## Chapter 1

# Compiling

Each program, subroutine, or function that calls the CDF library or references CDF parameters must include one or more CDF include filess. On VMS systems a logical name, CDF\$INC, that specifies the location of the CDF include filess is defined in the definitions files, DEFINITIONS.COM, provided with the CDF distribution. On UNIX systems (including Mac OS X) an environment variable, CDF\_INC, that serves the same purpose is defined in the definitions files definitions.<shell-type> where <shell-type> is the type of shell being used: C for the C-shell (csh and tcsh), K for the Korn (ksh), BASH, and POSIX shells, and B for the Bourne shell (sh). This section assumes that you are using the appropriate definitions files on those systems. The location of cdf.inc is specified as described in the appropriate sections for those systems.

On VMS and UNIX systems the following line would be included at/near the top of each routine:

```
INCLUDE '<inc-path>cdf.inc'
```

where <inc-path> is the files name of the directory containing cdf.inc. On VMS systems CDF\$INC: may be used for <inc-path>. On UNIX systems <inc-path> must be a relative or absolute files name. (An environment variable may not be used.) Another option would be to create a symbolic link to cdf.inc (using ln -s) making cdf.inc appear to be in the same directory as the source files to be compiled. In that case specifying <inc-path> would not be necessary. On UNIX systems you will need to know where on your system cdf.inc has been installed.

The cdf.inc include files declares the FUNCTIONs available in the CDF library (CDF var num, CDF lib, etc.). Some Fortran compilers will display warning messages about unused variables if these functions are not used in a routine (because they will be assumed to be variables not function declarations). Most of these Fortran compilers have a command line option (e.g., -nounused) that will suppress these warning messages. If a suitable command line option is not available (and the messages are too annoying to ignore), the function declarations could be removed from cdf.inc but be sure to declare each CDF function that a routine uses.<sup>1</sup>

#### Digital Visual Fortran<sup>1</sup>

On Windows NT/2000/XP systems using Digital Visual Fortran, the following lines would be included at the top of each routine/source files:

```
.
. (PROGRAM, SUBROUTINE, or FUNCTION statement)
.
INCLUDE 'cdfdvf.inc'
```

<sup>&</sup>lt;sup>1</sup> Normally, you need to run DFVARS.BAT in bin directory to set up the proper environement from the command prompt.

```
INCLUDE 'cdfdf.inc'
```

The include files cdfdvf.inc contains an INTERFACE statement for each subroutine/function in the CDF library. Including this files is absolutely essential no matter if you are using the Internal Interface (CDF lib) or Standard Interface (e.g., CDF create, etc.) cdfdvf.inc is located in the same directory as cdf.inc. The include file cdfdf.inc is similar to cdfdf.inc, with some statements commented out for Digital Visual Fortran compiler.

#### 1.1 VMS/OpenVMS Systems

An example of the command to compile a source file on VMS/OpenVMS systems would be as follows:

```
$ FORTRAN <source-name>
```

where <source-name> is the name of the source file being compiled. (The .FOR extension is not necessary.) The object module created will be named <source-name>.OBJ.

**NOTE:** If you are running OpenVMS on a DEC Alpha and are using a CDF distribution built for a default double-precision floating-point representation of D\_FLOAT, you will also have to specify /FLOAT=D\_FLOAT on the CC command line in order to correctly process double-precision floating-point values.

#### 1.2 UNIX Systems

An example of the command to compile a source file on UNIX flavored systems would be as follows:<sup>2</sup>

```
% f77 -c <source-name>.f
```

where <source-file>.f is the name of the source file being compiled. (The .f extension is required.)

The -c option specifies that only an object module is to be produced. (The link step is described in Chapter 2.) The object module created will be named <source-name>.o.

#### 1.3 Windows NT/2000/XP Systems, Digital Visual Fortran

An example of the command to compile a source file on Windows NT/95/98 systems using Digital Visual Fortran would be as follows:<sup>3</sup>

```
> DF /c /iface:nomixed_strfilesn_arg /nowarn /optimize:0 /I<inc-path> <source-name>.f
```

where <source-name>.f is the name of the source file being compiled (the .f extension is required) and <inc-path> is the file name of the directory containing cdfdvf.inc and cdfdf.inc. You will need to know where on your system cdfdvf.inc and cdfdf.inc have been installed. <inc-path> may be either an absolute or relative file name.

<sup>&</sup>lt;sup>2</sup> The name of the Fortran compiler may be different depending on the avor of UNIX being used.

<sup>&</sup>lt;sup>3</sup> This example assumes you have properly set the MS-DOS environment variables used by the Digital Visual Fortran compiler.

The /c option specifies that only an object module is to be produced. (The link step is described in Chapter 2.) The object module will be named <source-name>.obj.

The /iface:nomixed str len arg option specifies that Fortran string arguments will have their string lengths appended to the end of the argument list by the compiler.

The /optimize:0 option specifies that no code optimization is done. We had a problem using the default optimization.

The /nowarn option specifies that no warning messages will be given.

You can run the batch files, DFVARS.BAT, came with the Digital Visual Fortran, to set them up.

## Chapter 2

# Linking

Your applications must be linked with the CDF library. <sup>4</sup> Both the Standard and Internal interfaces for C applications are built into the CDF library. On VMS systems a logical name, CDF\$LIB, which specifies the location of the CDF library, is defined in the definitions file, DEFINITIONS.COM, provided with the CDF distribution. On UNIX systems (including Mac OS X)an environment variable, CDF\_LIB, which serves the same purpose, is defined in the definitions file definitions.<shell-type> where <shell-type> is the type of shell being used: C for the C-shell (csh and tcsh), K for the Korn (ksh), BASH, and POSIX shells, and B for the Bourne shell (sh). This section assumes that you are using the appropriate definitions file on those systems. On MS-DOS and Macintosh (MacOS) systems, definitions files are not available. The location of the CDF library is specified as described in the appropriate sections for those systems.

<sup>&</sup>lt;sup>4</sup> A shareable version of the CDF library is also available on VMS and some flavors of UNIX. Its use is described in Chapter 3. A dynamic link library (DLL), LIBCDF.DLL, is available on MS-DOS systems for Microsoft and Borland Windows applications. Consult the Microsoft and Borland documentation for details on using a DLL. Note that the DLL for Microsoft is created using Microsoft C 7.00.

#### 2.1 VAX/VMS & VAX/OpenVMS Systems

An example of the command to link your application with the CDF library (LIBCDF.OLB) on VAX/VMS and VAX/OpenVMS systems would be as follows:

```
$ LINK <object-file(s)>, CDF$LIB:LIBCDF/LIBRARY
```

where<object-file(s)> is your application's object module(s). (The .OBJ extension is not necessary.) The name of the executable created will be the name part of the first object file listed with .EXE appended. A different executable name may be specified by using the /EXECUTABLE qualifier.

It may also be necessary to specify SYS\$LIBRARY:VAXCRTL/LIBRARY at the end of the LINK command if your system does not properly define LNK\$LIBRARY (or LNK\$LIBRARY 1, etc.).

#### 2.2 DEC Alpha/OpenVMS Systems

An example of the command to link your application with the CDF library (LIBCDF.OLB) on DEC Alpha/OpenVMS systems would be as follows:

```
$ LINK <object-file(s)>, CDF$LIB:LIBCDF/LIBRARY, SYS$LIBRARY:<crtl>/LIBRARY
```

where <object-file(s)> is your application's object module(s) (the .OBJ extension is not necessary) and <crtl> is VAXCRTL if your CDF distribution is built for a default double-precision floating-point representation of G\_FLOAT or VAXCRTLD for a default of D\_FLOAT. (You must specify a VAX C run-time library because the CDF library is written in C.) The name of the executable created will be the name part of the first object file listed with .EXE appended. A different executable name may be specified by using the /EXECUTABLE qualifier.

#### 2.3 UNIX Systems

An example of the command to link your application with the CDF library (libcdf.a) on UNIX flavored systems would be as follows:

```
% f77 <object-file(s)>.o ${CDF LIB}/libcdf.a
```

where <object-file(s)>.o is your application's object module(s). (The .o extension is required.) The name of the executable created will be a.out by default. It may also be explicitly specified using the -o option. Some UNIX systems may also require that -lc (the C run-time library), -lm (the math library), and/or -ldl (the dynamic linker library) be specified at the end of the command line. This may depend on the particular release of the operating system being used. Note that in a "makefile" where CDF\_LIB is imported, \$(CDF\_LIB) would be specified instead of \${CDF\_LIB}.

#### 2.3.1 Combining the Compile and Link

On UNIX systems the compile and link may be combined into one step as follows:

```
% f77 <source-file(s)>.f ${CDF LIB}/libcdf.a
```

where <source-file(s)>.f is the name of the source file(s) being compiled/linked. (The .f extension is required.) Some UNIX systems may also require that -lc, -lm, and/or -ldl be specified at the end of the command line. Note that in a "makefile" where CDF LIB is imported, \$(CDF LIB) would be specified instead of \${CDF LIB}.

#### 2.4 Windows NT/2000/XP Systems, Digital Visual Fortran

NOTE: Even though your application is written in Fortran and compiled with a Fortran compiler, compatible C runtime system libraries (as supplied with Microsoft Visual C++) will be necessary to successfully link your application. This is because the CDF library is written in C and calls C run-time system functions.

An example of the command used to link an application to the CDF library (LIBCDF.LIB) on Windows NT/95/98 systems using Digital Visual Fortran and Microsoft Visual C++ would be as follows:<sup>5</sup>

```
> LINK <objs> <lib-path>libcdf.lib /out:<name.exe> /nodefaultlib:libcd
```

where <objs> is your application's object module(s) (the .obj extension is necessary); <name.exe> is the name of the executable file to be created and <lib-path> is the file name of the directory containing LIBCDF.LIB. You will need to know where on your system LIBCDF.LIB has been installed. lib-path> may be either an absolute or relative file

The /nodefaultlib:libcd option specifies that the LIBCD.LIB is to be ignored during the library search for resolving references.

8

<sup>&</sup>lt;sup>5</sup> This example assumes you have properly set the MS-DOS environment variables (e.g., LIB should be set to include directories that contain C's LIBC.LIB and Fortran's DFOR.LIB.)

## Chapter 3

# Linking Shared CDF Library

A shareable version of the CDF library is also available on VMS systems, some flavors of UNIX<sup>1</sup>, Windows NT/95/98<sup>2</sup> and Macintosh.<sup>3</sup> The shared version is put in the same directory as the non-shared version and is named as follows:

Machine/Operating System	Shared CDF Library
VAX (VMS & OpenVMS)	LIBCDF.EXE
DEC Alpha (OpenVMS)	LIBCDF.EXE
Sun (SOLARIS)	libcdf.so
HP 9000 (HP-UX) <sup>4</sup>	libcdf.sl
IBM RS6000 $(AIX)^4$	libcdf.o
DEC Alpha (OSF/1)	libcdf.so
SGi (6.x)	libcdf.so
Linux (PC & Power PC)	libcdf.so
Windows NT/2000/XP	dllcdf.dll
Macintosh OS X <sup>4</sup>	Libcdf.dylib

The commands necessary to link to a shareable library vary among operating systems. Examples are shown in the following sections.

#### 3.1 VAX (VMS & OpenVMS)

\$ ASSIGN CDF\$LIB:LIBCDF.EXE CDF\$LIBCDFEXE
\$ LINK <object-file(s)>, SYS\$INPUT:/OPTIONS
CDF\$LIBCDFEXE/SHAREABLE
SYS\$SHARE:VAXCRTL/SHAREABLE
<Control-Z>

<sup>&</sup>lt;sup>1</sup> On UNIX systems, when executing a program linked to the shared CDF library, the environment variable LD\_LIBRARY\_PATH must be set to include the directory containing libcdf.so or libcdf.sl.

<sup>&</sup>lt;sup>2</sup> When executing a program linked to the dynamically linked CDF library (DLL), the environment variable PATH must be set to include the directory containing dllcdf.dll.

<sup>&</sup>lt;sup>3</sup> On Mac systems, when executing a program linked to the shared CDF library, dllcdf.ppc or dllcdf.68k must be copied into System's Extension folder.

<sup>&</sup>lt;sup>4</sup> Not yet tested. Contact CDFsupport@listserv.gsfc.nasa.gov to coordinate the test.

\$ DEASSIGN CDF\$LIBCDFEXE

where<object-file(s)> is your application's object module(s). (The .OBJ extension is not necessary.) The name of the executable created will be the name part of the first object file listed with .EXE appended. A different executable name may be specified by using the /EXECUTABLE qualifier.

**NOTE:** on VAX/VMS and VAX/OpenVMS systems the shareable CDF library may also be installed in SYS\$SHARE. If that is the case, the link command would be as follows:

```
$ LINK <object-file(s)>, SYS$INPUT:/OPTIONS
SYS$SHARE:LIBCDF/SHAREABLE
SYS$SHARE:VAXCRTL/SHAREABLE
<Control-Z>
```

#### 3.2 DEC Alpha (OpenVMS)

```
$ ASSIGN CDF$LIB:LIBCDF.EXE CDF$LIBCDFEXE
$ LINK <object-file(s)>, SYS$INPUT:/OPTIONS
   CDF$LIBCDFEXE/SHAREABLE
   SYS$LIBRARY:<crt1>/LIBRARY
   <Control-Z>
$ DEASSIGN CDF$LIBCDFEXE
```

where <object-file(s)> is your application's object module(s) (the .OBJ extension is not necessary) and <crtl> is VAXCRTL if your CDF distribution is built for a default double-precision floating-point representation of G\_FLOAT or VAXCRTLD for a default of D\_FLOAT or VAXCRTLT for a default of IEEE\_FLOAT. (You must specify a VAX C run-time library [RTL] because the CDF library is written in C.) The name of the executable created will be the name part of the first object file listed with .EXE appended. A different executable name may be specified by using the /EXECUTABLE qualifier.

**NOTE:** on DEC Alpha/OpenVMS systems the shareable CDF library may also be installed in SYS\$SHARE. If that is the case, the link command would be as follows:

```
$ LINK <object-file(s)>, SYS$INPUT:/OPTIONS
SYS$SHARE:LIBCDF/SHAREABLE
SYS$LIBRARY:<crt1>/LIBRARY
<Control-Z>
```

#### 3.3 SUN (SOLARIS)

where <object-file(s)>.o is your application's object module(s) (the .o extension is required) and <exe-file> is the name of the executable file created. Note that in a "makefile" where CDF\_LIB is imported, \$(CDF\_LIB) would be specified instead of \${CDF\_LIB}.

#### 3.4 HP 9000 (HP-UX)

```
% f77 -o <exe-file> <object-file(s)>.o ${CDF LIB}/libcdf.sl -lc -lm
```

where <object-file(s)>.o is your application's object module(s) (the .o extension is required) and <exe-file> is the name of the executable file created. Note that in a "makefile" where CDF\_LIB is imported, \$(CDF\_LIB) would be specified instead of \${CDF\_LIB}.

#### 3.5 IBM RS6000 (AIX)

```
% f77 -o <exe-file> <object-file(s)>.o -L${CDF LIB} ${CDF LIB}/libcdf.o -lc -lm
```

where <object-file(s)>.o is your application's object module(s) (the .o extension is required) and <exe-file> is the name of the executable file created. Note that in a "makefile" where CDF\_LIB is imported, \$(CDF\_LIB) would be specified instead of \${CDF\_LIB}.

#### 3.6 DEC Alpha (OSF/1)

```
% f77 -o <exe-file> <object-file(s)>.o ${CDF LIB}/libcdf.so -lm -lc
```

where <object-file(s)>.o is your application's object module(s) (the .o extension is required) and <exe-file> is the name of the executable file created. Note that in a "makefile" where CDF\_LIB is imported, \$(CDF\_LIB) would be specified instead of \${CDF\_LIB}.

#### 3.7 SGi (IRIX 6.x)

```
% f77 -o <exe-file> <object-file(s)>.o ${CDF LIB}/libcdf.so -lm -lc
```

where <object-file(s)>.o is your application's object module(s) (the .o extension is required) and <exe-file> is the name of the executable file created. Note that in a "makefile" where CDF\_LIB is imported, \$(CDF\_LIB) would be specified instead of \${CDF\_LIB}.

#### 3.8 Linux (PC & Power PC)

```
% g77 -o <exe-file> <object-file(s)>.o ${CDF LIB}/libcdf.so -lm -lc
```

where <object-file(s)>.o is your application's object module(s) (the .o extension is required) and <exe-file> is the name of the executable file created. Note that in a "makefile" where CDF\_LIB is imported, \$(CDF\_LIB) would be specified instead of \${CDF\_LIB}.

#### **3.9** Windows (NT/2000/XP)

where <object-file(s)>.obj is your application's object module(s) (the .obj extension is required) and <exe-file>.exe is the name of the executable file created, and lib-path> may be either an absolute or relative directory name that has dllcdf.lib. The environment variable LIB has to set to the directory that contains LIBC.LIB. Your PATH environment variable needs to be set to include the directory that contains dllcdf.dll when the executable is run.

## Chapter 4

# **Programming Interface**

The following sections describe various aspects of the Fortran programming interface for CDF applications. These include constants and types defined for use by all CDF application programs written in Fortran. These constants and types are defined in cdf.inc. The file cdf.inc should be INCLUDEed in all application source files referencing CDF routines/parameters.

#### 4.1 Argument Passing

The CDF library is written entirely in C. Most computer systems have Fortran and C compilers that allow a Fortran application to call a C function without being concerned that different programming languages are involved. The CDF library takes advantage of the mechanisms provided by these compilers so that your Fortran application can appear to be calling another Fortran subroutine/function (in actuality the CDF library written in C). Pass all arguments exactly as shown in the description of each CDF function. This includes character strings (i.e., %REF(...) is not required). Be aware, however, that trailing blanks on variable and attribute names will be considered as part of the name. If the trailing blanks are not desired, pass only the part of the character string containing the name (e.g., VAR NAME(1:8)).

**NOTE:** Unfortunately, the Microsoft C and Microsoft Fortran compilers on the IBM PC and the C and Fortran compilers on the NeXT computer do not provide the needed mechanism to pass character strings from Fortran to C without explicitly NUL terminating the strings. Your Fortran application must place an ASCII NUL character after the last character of a CDF, variable, or attribute name. An example of this follows:

```
CHARACTER ATTR_NAME*9 ! Attribute name

.
ATTR_NAME(1:8) = 'VALIDMIN' ! Actual attribute name
ATTR_NAME(9:9) = CHAR(0) ! ASCII NUL character
.
```

CHAR(0) is an intrinsic Fortran function that returns the ASCII character for the numerical value passed in (0 is the numerical value for an ASCII NUL character). ATTR\_NAME could then be passed to one of the CDF library functions.

When the CDF library passes out a character string on an IBM PC (using the Microsoft compilers) or on a NeXT computer, the number of characters written will be exactly as shown in the description of the function called. You must declare your Fortran variable to be exactly that size.

#### 4.2 Item Referencing

For Fortran applications all items are referenced starting at one (1). These include variable, attribute, and attribute entry numbers, record numbers, dimensions, and dimension indices. Note that both rVariables and zVariables are numbered starting at one (1).

#### 4.3 Status Code Constants

These constants are of type INTEGER\*4.

CDF\_OK A status code indicating the normal completion of a CDF function.

CDF WARN Threshold constant for testing severity of non-normal CDF status codes.

Chapter 7 describes how to use these constants to interpret status codes.

#### 4.4 CDF Formats

SINGLE FILE The CDF consists of only one file. This is the default file format.

MULTI FILE The CDF consists of one header file for control and attribute data and one

additional file for each variable in the CDF.

#### 4.5 CDF Data Types

One of the following constants must be used when specifying a CDF data type for an attribute entry or variable.

CDF\_BYTE 1-byte, signed integer.

CDF\_CHAR 1-byte, signed character.

CDF INT1 1-byte, signed integer.

CDF\_UCHAR 1-byte, unsigned character.

CDF\_UINT1 1-byte, unsigned integer.

CDF\_INT2 2-byte, signed integer.

CDF UINT2 2-byte, unsigned integer.

CDF\_INT4 4-byte, signed integer.

CDF\_UINT4 4-byte, unsigned integer.

CDF\_REAL4 4-byte, floating point.

CDF\_FLOAT 4-byte, floating point.

CDF REAL8 8-byte, floating point.

CDF DOUBLE 8-byte, floating point.

CDF\_EPOCH 8-byte, floating point.

CDF EPOCH16 two 8-byte, floating point.

CDF\_CHAR and CDF\_UCHAR are considered character data types. These are significant because only variables of these data types may have more than one element per value (where each element is a character).

**NOTE:** When using a DEC Alpha running OSF/1 keep in mind that a long is 8 bytes and that an int is 4 bytes. Use int C variables with the CDF data types CDF INT4 and CDF UINT4 rather than long C variables.

**NOTE:** When using an PC (MS-DOS) keep in mind that an int is 2 bytes and that a long is 4 bytes. Use long C variables with the CDF data types CDF\_INT4 and CDF\_UINT4 rather than int C variables.

#### 4.6 Data Encodings

A CDF's data encoding affects how its attribute entry and variable data values are stored (on disk). Attribute entry and variable values passed into the CDF library (to be written to a CDF) should always be in the host machine's native encoding. Attribute entry and variable values read from a CDF by the CDF library and passed out to an application will be in the currently selected decoding for that CDF (see the Concepts chapter in the CDF User's Guide).

HOST_ENCODING	Indicates	host	machine	data	representation	(native).	This is th	e default

encoding, and it will provide the greatest performance when

reading/writing on a machine of the same type.

NETWORK\_ENCODING Indicates network transportable data representation (XDR).

VAX ENCODING Indicates VAX data representation. Double-precision floating-point

values are encoded in Digital's D\_FLOAT representation.

ALPHAVMSd ENCODING Indicates DEC Alpha running OpenVMS data representation. Double-

precision floating-point values are encoded in Digital's D\_FLOAT

representation.

ALPHAVMSg ENCODING Indicates DEC Alpha running OpenVMS data representation. Double-

precision floating-point values are encoded in Digital's G\_FLOAT

representation.

ALPHAVMSi ENCODING Indicates DEC Alpha running OpenVMS data representation. Double-

precision floating-point values are encoded in IEEE representation.

ALPHAOSF1 ENCODING Indicates DEC Alpha running OSF/1 data representation.

SUN\_ENCODING Indicates SUN data representation.

SGi ENCODING Indicates Silicon Graphics Iris and Power Series data representation.

DECSTATION ENCODING

Indicates DECstation data representation.

IBMRS\_ENCODING Indicates IBMRS data representation (IBM RS6000 series).

HP ENCODING Indicates HP data representation (HP 9000 series).

PC ENCODING Indicates PC data representation.

NeXT ENCODING Indicates NeXT data representation.

MAC\_ENCODING Indicates Macintosh data representation.

When creating a CDF (via the Standard interface) or respecifying a CDF's encoding (via the Internal Interface), you may specify any of the encodings listed above. Specifying the host machine's encoding explicitly has the same effect as specifying HOST\_ENCODING.

When inquiring the encoding of a CDF, either NETWORK\_ENCODING or a specific machine encoding will be returned. (HOST ENCODING is never returned.)

#### 4.7 Data Decodings

A CDF's decoding affects how its attribute entry and variable data values are passed out to a calling application. The decoding for a CDF may be selected and reselected any number of times while the CDF is open. Selecting a decoding does not affect how the values are stored in the CDF file(s) - only how the values are decoded by the CDF library. Any decoding may be used with any of the supported encodings. The Concepts chapter in the CDF User's Guide describes a CDF's decoding in more detail.

HOST DECODING Indicates host machine data representation (native). This is the default

decoding.

NETWORK DECODING Indicates network transportable data representation (XDR).

VAX DECODING Indicates VAX data representation. Double-precision floating-point

values will be in Digital's D FLOAT representation.

ALPHAVMSd DECODING Indicates DEC Alpha running OpenVMS data representation. Double-

precision floating-point values will be in Digital's D FLOAT

representation.

ALPHAVMSg DECODING Indicates DEC Alpha running OpenVMS data representation. Double-

precision floating-point values will be in Digital's G FLOAT

representation.

ALPHAVMSi DECODING Indicates DEC Alpha running OpenVMS data representation. Double-

precision floating-point values will be in IEEE representation.

ALPHAOSF1\_DECODING Indicates DEC Alpha running OSF/1 data representation.

SUN DECODING Indicates SUN data representation.

SGi\_DECODING Indicates Silicon Graphics Iris and Power Series data representation.

DECSTATION DECODING Indicates DECstation data representation.

IBMRS DECODING Indicates IBMRS data representation (IBM RS6000 series).

HP DECODING Indicates HP data representation (HP 9000 series).

PC DECODING Indicates PC data representation.

NeXT DECODING Indicates NeXT data representation.

MAC\_DECODING Indicates Macintosh data representation.

The default decoding is HOST\_DECODING. The other decodings may be selected via the Internal Interface with the <SELECT\_,CDF\_DECODING\_> operation. The Concepts chapter in the CDF User's Guide describes those situations in which a decoding other than HOST\_DECODING may be desired.

#### 4.8. Variable Majorities

A CDF's variable majority determines the order in which variable values (within the variable arrays) are stored in the CDF file(s). The majority is the same for rVariable and zVariables.

ROW\_MAJOR C-like array ordering for variable storage. The first dimension in each

variable array varies the slowest. This is the default majority.

COLUMN\_MAJOR Fortran-like array ordering for variable storage. The first dimension in

each variable array varies the fastest.

Knowing the majority of a CDF's variables is necessary when performing hyper reads and writes. During a hyper read the CDF library will place the variable data values into the memory buffer in the same majority as that of the variables. The buffer must then be processed according to that majority. Likewise, during a hyper write, the CDF library will expect to find the variable data values in the memory buffer in the same majority as that of the variables.

The majority must also be considered when performing sequential reads and writes. When sequentially reading a variable, the values passed out by the CDF library will be ordered according to the majority. When sequentially writing a variable, the values passed into the CDF library are assumed (by the CDF library) to be ordered according to the majority.

As with hyper reads and writes, the majority of a CDF's variables affects multiple variable reads and writes. When performing a multiple variable write, the full-physical records in the buffer passed to the CDF library must have the CDF's variable majority. Likewise, the full-physical records placed in the buffer by the CDF library during a multiple variable read will be in the CDF's variable majority.

For Fortran applications the compiler defined majority for arrays is column major. The first dimension of multidimensional arrays varies the fastest in memory.

#### 4.9 Record/Dimension Variances

Record and dimension variances affect how variable data values are physically stored.

VARY True record or dimension variance.

NOVARY False record or dimension variance.

If a variable has a record variance of VARY, then each record for that variable is physically stored. If the record variance is NOVARY, then only one record is physically stored. (All of the other records are virtual and contain the same values.)

If a variable has a dimension variance of VARY, then each value/subarray along that dimension is physically stored. If the dimension variance is NOVARY, then only one value/subarray along that dimension is physically stored. (All other values/subarrays along that dimension are virtual and contain the same values.)

#### 4.10 Compressions

The following types of compression for CDFs and variables are supported. For each, the required parameters are also listed. The Concepts chapter in the CDF User's Guide describes how to select the best compression type/parameters for a particular data set.

NO COMPRESSION

No compression.

RLE\_COMPRESSION

Run-length encoding compression. There is one parameter.

1. The style of run-length encoding. Currently, only the run-length encoding of zeros is supported. This parameter must be set to RLE OF ZEROs.

**HUFF\_COMPRESSION** 

Huffman compression. There is one parameter.

1. The style of Huffman encoding. Currently, only optimal encoding trees are supported. An optimal encoding tree is determined for each block of bytes being compressed. This parameter must be set to OPTIMAL\_ENCODING\_TREES.

AHUFF\_COMPRESSION

Adaptive Huffman compression. There is one parameter.

 The style of adaptive Huffman encoding. Currently, only optimal encoding trees are supported. An optimal encoding tree is determined for each block of bytes being compressed. This parameter must be set to OPTIMAL\_ENCODING\_TREES.

**GZIP COMPRESSION** 

Gnu's "zip" compression.<sup>5</sup> There is one parameter.

 The level of compression. This may range from 1 to 9. 1 provides the least compression and requires less execution time. 9 provides the most compression but requires the most execution time. Values inbetween provide varying compromises of these two extremes.

#### 4.11 Sparseness

#### 4.11.1 Sparse Records

<sup>5</sup> Disabled for PC running 16-bit DOS/Windows 3.x.

The following types of sparse records for variables are supported.

NO\_SPARSERECORDS No sparse records.

PAD\_SPARSERECORDS Sparse records - the variable's pad value is used when reading values from

a missing record.

PREV SPARSERECORDS Sparse records - values from the previous existing record are used when

reading values from a missing record. If there is no previous existing

record the variable's pad value is used.

#### 4.11.2 Sparse Arrays

The following types of sparse arrays for variables are supported.<sup>6</sup>

NO\_SPARSEARRAYS No sparse arrays.

#### 4.12 Attribute Scopes

Attribute scopes are simply a way to explicitly declare the intended use of an attribute by user applications (and the CDF toolkit).

GLOBAL\_SCOPE Indicates that an attribute's scope is global (applies to the CDF as a

whole).

VARIABLE SCOPE Indicates that an attribute's scope is by-variable. (Each rEntry or zEntry

corresponds to an rVariable or zVariable, respectively.)

#### 4.13 Read-Only Modes

Once a CDF has been opened, it may be placed into a read-only mode to prevent accidental modification (such as when the CDF is simply being browsed). Read-only mode is selected via the Internal Interface using the <SELECT, CDF READONLY MODE > operation.

READONLYon Turns on read-only mode.

READONLYoff Turns off read-only mode.

#### 4.14 zModes

<sup>6</sup> Obviously, sparse arrays are not yet supported.

Once a CDF has been opened, it may be placed into one of two variations of zMode. zMode is fully explained in the Concepts chapter in the CDF User's Guide. A zMode is selected for a CDF via the Internal Interface using the <SELECT ,CDF zMODE > operation.

zMODEoff Turns off zMode.

zMODEon1 Turns on zMode/1.

zMODEon2 Turns on zMode/2.

#### 4.15 -0.0 to 0.0 Modes

Once a CDF has been opened, the CDF library may be told to convert -0.0 to 0.0 when read from or written to that CDF. This mode is selected via the Internal Interface using the <SELECT\_,CDF\_NEGtoPOSfp0\_MODE\_> operation.

NEGtoPOSfp0on Convert -0.0 to 0.0 when read from or written to a CDF.

NEGtoPOSfp0off Do not convert -0.0 to 0.0 when read from or written to a CDF.

#### 4.16 Operational Limits

These are limits within the CDF library. If you reach one of these limits, please contact CDF User Support.

CDF\_MAX\_DIMS Maximum number of dimensions for the rVariables or a zVariable.

CDF MAX PARMS Maximum number of compression or sparseness parameters.

The CDF library imposes no limit on the number of variables, attributes, or attribute entries that a CDF may have. On the PC, however, the number of rVariables and zVariables will be limited to 100 of each in a multi-file CDF because of the 8.3 naming convention imposed by MS-DOS.

#### 4.17 Limits of Names and Other Character Strings

CDF\_PATHNAME\_LEN Maximum length of a CDF file name (excluding the .cdf or .vnn appended

by the CDF library to construct file names). A CDF file name may contain disk and directory specifications that conform to the conventions of the operating systems being used (including logical names on VMS

systems and environment variables on UNIX systems).

CDF VAR NAME LEN Maximum length of a variable name.

CDF ATTR NAME LEN Maximum length of an attribute name.

CDF\_COPYRIGHT\_LEN Maximum length of the CDF copyright text.

CDF STATUSTEXT LEN Maximum length of the explanation text for a status code.

### Chapter 5

## Standard Interface

The following sections describe the Standard Interface routines callable from Fortran applications. Most functions return a status code of type INTEGER\*4 (see Chapter 7). The Internal Interface is described in Chapter 6. An application can use both interfaces when necessary. Note that zVariables and vAttribute zEntries are only accessible via the Internal Interface.

#### 5.1 CDF\_create

SUBROUTINE CDF create (

```
CDF name*(*),
                                        ! in -- CDF file name.
CHARACTER
                                        ! in -- Number of dimensions, rVariables.
INTEGER*4
                num dims,
                                        ! in -- Dimension sizes, rVariables.
INTEGER*4
                dim_sizes(*),
INTEGER*4
                encoding,
                                        ! in -- Data encoding.
INTEGER*4
                majority,
                                        ! in -- Variable majority.
INTEGER*4
                                        ! out -- CDF identifier.
                id,
INTEGER*4
                                        ! out -- Completion status
                status)
```

CDF\_create creates a CDF as defined by the arguments. A CDF cannot be created if it already exists. (The existing CDF will not be overwritten.) If you want to overwrite an existing CDF, you must first open it with CDF\_open, delete it with CDF\_delete, and then recreate it with CDF\_create. If the existing CDF is corrupted, the call to CDF\_open will fail. (An error code will be returned.) In this case you must delete the CDF at the command line. Delete the dotCDF file (having an extension of .cdf), and if the CDF has the multi-file format, delete all of the variable files (having extensions of .v0,.v1,... and .z0,.z1,...).

The arguments to CDF\_create are defined as follows:

CDF\_name The file name of the CDF to create. (Do not specify an extension.) This may be at most

CDF\_PATHNAME\_LEN characters. A CDF file name may contain disk and directory specifications that conform to the conventions of the operating system being used (including

logical names on VMS systems and environment variables on UNIX systems).

**UNIX:** File names are case-sensitive.

num dims Number of dimensions the rVariables in the CDF are to have. This may be as few as zero

(0) and at most CDF\_MAX\_DIMS.

dim_sizes	The size of each dimension. Each element of dim_sizes specifies the corresponding dimension size. Each size must be greater then zero (0). For 0-dimensional rVariables this argument is ignored (but must be present).
encoding	The encoding for variable data and attribute entry data. Specify one of the encodings described in Section 4.6.
majority	The majority for variable data. Specify one of the majorities described in Section 4.8.
id	The identifier for the created CDF. This identifier must be used in all subsequent operations on the CDF.
status	The completion status code. Chapter 7 explains how to interpret status codes.

When a CDF is created, both read and write access are allowed. The default format for a CDF created with CDF\_create is specified in the configuration file of your CDF distribution. Consult your system manager for this default. The CDF\_lib function (Internal Interface) may be used to change a CDF's format.

**NOTE:** CDF\_close must be used to close the CDF before your application exits to ensure that the CDF will be correctly written to disk (see Section 5.5).

#### **5.1.1 Example(s)**

The following example will create a CDF named test1 with network encoding and row majority.

ROW MAJOR and NETWORK ENCODING are defined in cdf.inc.

#### 5.2 CDF\_open

SUBROUTINE CDF open (

```
CHARACTER CDF_name*(*), ! in -- CDF file name.

INTEGER*4 id, ! out -- CDF identifier.

INTEGER*4 status) ! out -- Completion status
```

CDF\_open opens an existing CDF. The CDF is initially opened with only read access. This allows multiple applications to read the same CDF simultaneously. When an attempt to modify the CDF is made, it is automatically closed and reopened with read/write access. (The function will fail if the application does not have or cannot get write access to the CDF.)

The arguments to CDF open are defined as follows:

CDF\_name The file name of the CDF to open. (Do not specify an extension.) This may be at most

CDF\_PATHNAME\_LEN characters. A CDF file name may contain disk and directory specifications that conform to the conventions of the operating system being used (including logical names on VMS systems and environment variables on UNIX systems).

**UNIX:** File names are case-sensitive.

id The identifier for the opened CDF. This identifier must be used in all subsequent operations

on the CDF.

status The completion status code. Chapter 7 explains how to interpret status codes.

**NOTE:** CDF\_close must be used to close the CDF before your application exits to ensure that the CDF will be correctly written to disk (see Section 5.5).

#### **5.2.1 Example(s)**

The following example will open a CDF named NOAA1.

#### 5.3 CDF\_doc

SUBROUTINE CDF doc (

```
INTEGER*4 id, ! in -- CDF identifier.

INTEGER*4 version, ! out -- Version number.

INTEGER*4 release, ! out -- Release number.

CHARACTER copy_right*(CDF_COPYRIGHT_LEN), ! out -- Copyright.

INTEGER*4 status) ! out -- Completion status
```

CDF\_doc is used to inquire general documentation about a CDF. The version/release of the CDF library that created the CDF is provided (e.g., CDF V2.4 is version 2, release 4) along with the CDF copyright notice.

The arguments to CDF doc are defined as follows:

id The identifier of the CDF. This identifier must have been initialized by a call to CDF\_create

or CDF\_open.

version The version number of the CDF library that created the CDF.

release The release number of the CDF library that created the CDF.

copy\_right The copyright notice of the CDF library that created the CDF. This character string must be

large enough to hold CDF\_COPYRIGHT\_LEN characters and will be blank padded if necessary. This string will contain a newline character after each line of the copyright

notice.

status The completion status code. Chapter 7 explains how to interpret status codes.

The copyright notice is formatted for printing without modification. The version and release are used together (e.g., CDF V2.4 is version 2, release 4).

#### **5.3.1 Example(s)**

The following example will inquire and display the version/release and copyright notice.

```
INCLUDE '<path>cdf.inc'
INTEGER*4 id
                                             ! CDF identifier.
                                             ! Returned status code.
INTEGER*4 status
INTEGER*4 version
                                             ! CDF version number.
INTEGER*4 release
                                             ! CDF release number.
CHARACTER copyright* (CDF COPYRIGHT LEN)
                                            ! Copyright notice.
INTEGER*4 last char
                                             ! Last character position
                                             ! actually used in the copyright.
                                             ! Starting character position
INTEGER*4 start char
                                             ! ina line of the copyright.
CHARACTER lf*1
                                             ! Linefeed character.
```

```
CALL CDF doc (id, version, release, copyright, status)
   IF (status .LT. CDF OK) THEN
                                                  ! INFO status codes ignored
       CALL UserStatusHandler (status)
   ELSE
       WRITE (6,101) version, release
101
       FORMAT (' ','Version: ',I3,' Release:',I3)
       last CHARACTER= CDF COPYRIGHT LEN
       DO WHILE (copyright(last char:last char) .EQ. ' ')
          last CHARACTER= last CHARACTER- 1
       END DO
       lf = CHAR(10)
       start CHARACTER= 1
       DO i = 1, last char
          IF (copyright(i:i) .EQ. lf) THEN
              WRITE (6,301) copyright(start char:i-1)
301
              FORMAT (' ',A)
              start CHARACTER= i + 1
          END IF
       END DO
   END IF
```

#### 5.4 CDF inquire

SUBROUTINE CDF inquire(

```
INTEGER*4 id,
                                                ! in -- CDF identifier
INTEGER*4 num dims,
                                                ! out -- Number of dimensions, rVariables.
INTEGER*4 dim sizes(CDF MAX DIMS),
                                                ! out -- Dimension sizes, rVariables.
                                                ! out -- Data encoding.
INTEGER*4 encoding,
                                                ! out -- Variable majority.
INTEGER*4 majority,
                                                ! out -- Maximum record number in the CDF, rVariables.
INTEGER*4 max rec,
                                                ! out -- Number of rVariables in the CDF.
INTEGER*4 num vars,
                                                ! out -- Number of attributes in the CDF.
INTEGER*4 num attrs,
                                                ! out -- Completion status
INTEGER*4 status)
```

CDF\_inquire inquires the basic characteristics of a CDF. An application needs to know the number of rVariable dimensions and their sizes before it can access rVariable data. Knowing the variable majority can be used to optimize performance and is necessary to properly use the variable hyper functions (for both rVariables and zVariables).

The arguments to CDF\_inquire are defined as follows:

The identifier of the CDF. This identifier must have been initialized by a call to CDF\_create or CDF\_open.

The number of dimensions for the rVariables in the CDF.

The dimension sizes of the rVariables in the CDF. dim sizes is a 1-dimensional array

containing one element per dimension. Each element of dim\_sizes receives the

corresponding dimension size. For 0-dimensional rVariables this argument is ignored (but must be present).

encoding The encoding of the variable data and attribute entry data. The encodings are defined in

Section 4.6.

majority The majority of the variable data. The majorities are defined in Section 4.8.

max\_rec The maximum record number written to an rVariable in the CDF. Note that the maximum

record number written is also kept separately for each rVariable in the CDF. The value of max\_rec is the largest of these. Some rVariables may have fewer records actually written. CDF\_lib (Internal Interface) may be used to inquire the maximum record written for an

individual rVariable (see Section 6).

num\_vars The number of rVariables in the CDF.

status The completion status code. Chapter 7 explains how to interpret status codes.

#### **5.4.1 Example(s)**

The following example will inquire the basic information about a CDF.

```
INCLUDE '<path>cdf.inc'
INTEGER*4 id
                                        ! CDF identifier.
INTEGER*4 status
                                        ! Returned status code.
INTEGER*4 num dims
                                        ! Number of dimensions, rVariables.
INTEGER*4 dim sizes(CDF MAX DIMS)
                                        ! Dimension sizes, rVariables
                                        ! (allocate to allow the maximum
                                        ! number of dimensions).
INTEGER*4 encoding
                                        ! Data encoding.
                                        ! Variable majority.
INTEGER*4 majority
                                        ! Maximum record number.
INTEGER*4 max rec
                                       ! Number of rVariables in CDF.
INTEGER*4 num vars
INTEGER*4 num attrs
                                       ! Number of attributes in CDF.
CALL CDF inquire (id, num dims, dim sizes, encoding, majority,
max rec, num vars, num attrs, status)
IF (status .NE. CDF OK) CALL UserStatusHandler (status)
```

#### 5.5 CDF\_close

```
SUBROUTINE CDF close (
```

```
INTEGER*4 id, ! in -- CDF identifier.

INTEGER*4 status) ! out -- Completion status
```

CDF\_close closes the specified CDF. The CDF's cache buffers are ushed; the CDF's open file is closed (or files in the case of a multi-file CDF); and the CDF identifier is made available for reuse.

**NOTE:** You must close a CDF with CDF\_close to guarantee that all modifications you have made will actually be written to the CDF's file(s). If your program exits, normally or otherwise, without a successful call to CDF\_close, the CDF's cache buffers are left unushed.

The arguments to CDF close are defined as follows:

```
The identifier of the CDF. This identifier must have been initialized by a call to CDF_create or CDF open.
```

status The completion status code. Chapter 7 explains how to interpret status codes.

#### **5.5.1 Example(s)**

The following example will close an open CDF.

```
.
INCLUDE '<path>cdf.inc'
.
INTEGER*4 id     ! CDF identifier.
INTEGER*4 status    ! Returned status code.
.
CALL CDF_close (id, status)
IF (status .NE. CDF_OK) CALL UserStatusHandler (status)
.
.
```

#### 5.6 CDF\_delete

```
SUBROUTINE CDF_delete (
```

```
INTEGER*4 id, ! in -- CDF identifier.
INTEGER*4 status) ! out -- Completion status
```

CDF\_delete deletes the specified CDF. The CDF files deleted include the dotCDF file (having an extension of .cdf), and if a multi-file CDF, the variable files (having extensions of .v0,.v1,... and .z0,.z1,...).

You must open a CDF before you are allowed to delete it. If you have no privilege to delete the CDF files, they will not be deleted. If the CDF is corrupted and cannot be opened, the CDF file(s) must be deleted at the command line.

The arguments to CDF\_delete are defined as follows:

The identifier of the CDF. This identifier must have been initialized by a call to CDF\_create or CDF\_open.

status The completion status code. Chapter 7 explains how to interpret status codes.

#### **5.6.1 Example(s)**

The following example will open and then delete an existing CDF.

#### 5.7 CDF\_error

```
SUBROUTINE CDF_error (
```

```
INTEGER*4 status, ! in -- Status code.

CHARACTER message*(CDF_STATUSTEXT_LEN)) ! out -- Explanation text for the status code.
```

CDF\_error is used to inquire the explanation of a given status code (not just error codes). Chapter 7 explains how to interpret status codes and Appendix A lists all of the possible status codes.

The arguments to CDF\_error are defined as follows:

```
status The status code to check.

The explanation of the status code. This character string must be large enough to hold CDF STATUSTEXT LEN characters and will be blank padded if necessary.
```

#### **5.7.1 Example(s)**

The following example displays the explanation text if an error code is returned from a call to CDF open.

```
INCLUDE '<path>cdf.inc'
INTEGER*4 id
                                        ! CDF identifier.
INTEGER*4 status
                                       ! Returned status code.
CHARACTER text*(CDF STATUSTEXT LEN)
                                       ! Explanation text.
INTEGER*4 last char
                                        ! Last character position
                                        ! actually used in the copyright.
CALL CDF_open ('giss wetl', id, status)
IF (status .LT. CDF WARN) THEN
                                        ! INFO and WARNING codes ignored.
    CALL CDF error (status, text)
    last CHARACTER= CDF STATUSTEXT LEN
    DO WHILE (text(last_char:last_char) .EQ. ' ')
       last CHARACTER= last CHARACTER- 1
    END DO
    WRITE (6,101) text(1:last char)
    FORMAT (' ', 'ERROR> ', A)
END IF
```

#### 5.8 CDF attr create

SUBROUTINE CDF\_attr\_create (

```
INTEGER*4 id,
                                       ! in -- CDF identifier.
CHARACTER attr name*(*),
                                      ! in -- Attribute name.
                                      ! in -- Scope of attribute.
INTEGER*4
             attr scope,
                                      ! out -- Attribute number.
INTEGER*4
             attr num,
                                       ! out -- Completion status
INTEGER*4
             status)
```

CDF attr create creates an attribute in the specified CDF. An attribute with the same name must not already exist in the CDF.

The arguments to CDF attr create are defined as follows:

id	The identifier of the CDF. This identifier must have been initialized by a call to CDF_create or CDF_open.
attr_name	The name of the attribute to create. This may be at most CDF_ATTR_NAME_LEN characters. Attribute names are case-sensitive.
attr_scope	The scope of the new attribute. Specify one of the scopes described in Section 4.12.
attr_num	The number assigned to the new attribute. This number must be used in subsequent CDF function calls when referring to this attribute. An existing attribute's number may be determined with the CDF_attr_num function.
status	The completion status code. Chapter 7 explains how to interpret status codes.

#### **5.8.1 Example(s)**

The following example creates two attributes. The TITLE attribute is created with global scope - it applies to the entire CDF (most likely the title of the data set stored in the CDF). The Units attribute is created with variable scope - each entry describes some property of the corresponding variable (in this case the units for the data).

```
INCLUDE '<path>cdf.inc'
INTEGER*4 id
                                  ! CDF identifier.
INTEGER*4 status
                                  ! Returned status code.
CHARACTER UNITS attr name*5
                                 ! Name of "Units" attribute.
INTEGER*4 UNITS attr num
                                 ! "Units" attribute number.
INTEGER*4 TITLE attr num
                                  ! "TITLE" attribute number.
INTEGER*4 TITLE attr scope
                                  ! "TITLE" attribute scope.
DATA UNITS attr name/'Units'/, TITLE attr scope/GLOBAL SCOPE/
CALL CDF attr create (id, 'TITLE', TITLE attr scope, TITLE attr num, status)
IF (status .NE. CDF OK) CALL UserStatusHandler (status)
CALL CDF attr create (id, UNITS_attr_name, VARIABLE_SCOPE, UNITS_attr_num,
                      status)
IF (status .NE. CDF OK) CALL UserStatusHandler (status)
```

#### 5.9 CDF\_attr\_num

```
INTEGER*4 FUNCTION CDF attr num (
```

```
INTEGER*4 id, ! in-- CDF id CHARACTER attr name*(*)); ! in-- attribute name
```

CDF\_attr\_num is used to determine the attribute number associated with a given attribute name. If the attribute is found, CDF\_attr\_num returns its number - which will be equal to or greater than one (1). If an error occurs (e.g., the attribute name does not exist in the CDF), an error code (of type INTEGER\*4) is returned. Error codes are less than zero (0).

The arguments to CDF attr num are defined as follows:

The identifier of the CDF. This identifier must have been initialized by a call to CDF\_create or CDF\_open.

The name of the attribute for which to search. This may be at most

CDF ATTR NAME LEN characters. Attribute names are case-sensitive.

CDF\_attr\_num may be used as an embedded function call when an attribute number is needed. CDF attr num is declared in cdf.inc. (Fortran functions must be declared so that the returned value is interpreted correctly.)

#### **5.9.1 Example(s)**

In the following example the attribute named pressure will be renamed to PRESSURE with CDF\_attr\_num being used as an embedded function call. Note that if the attribute pressure did not exist in the CDF, the call to CDF\_attr\_num would have returned an error code. Passing that error code to CDF\_attr\_rename as an attribute number would have resulted in CDF attr\_rename also returning an error code. CDF attr\_rename is described in Section 5.10.

```
.
INCLUDE '<path>cdf.inc'
.
INTEGER*4 id     ! CDF identifier.
INTEGER*4 status    ! Returned status code.
.
CALL CDF_attr_rename (id, CDF_attr_num(id, 'pressure'), 'PRESSURE', status)
IF (status .NE. CDF_OK) CALL UserStatusHandler (status)
.
```

#### 5.10 CDF attr rename

```
SUBROUTINE CDF_attr_rename (

INTEGER*4 id, ! in -- CDF identifier.

INTEGER*4 attr_num, ! in -- Attribute number.

CHARACTER attr_name*(*), ! in -- New attribute name.

INTEGER*4 status) ! out -- Completion status
```

CDF\_attr\_rename is used to rename an existing attribute. An attribute with the new name must not already exist in the CDF.

The arguments to CDF\_attr\_rename are defined as follows:

```
The identifier of the CDF. This identifier must have been initialized by a call to CDF_create or CDF_open.

The number of the attribute to rename. This number may be determined with a call to CDF_attr_num (see Section 5.9).

The new attribute name. This may be at most CDF_ATTR_NAME_LEN characters. Attribute names are case-sensitive.

The completion status code. Chapter 7 explains how to interpret status codes.
```

#### **5.10.1 Example(s)**

In the following example the attribute named LAT is renamed to LATITUDE.

```
INCLUDE '<path>cdf.inc'

INCLUDE '<path>cdf.inc'

INTEGER*4 id ! CDF identifier.
INTEGER*4 status ! Returned status code.

CALL CDF_attr_rename (id, CDF_attr_num(id, 'LAT'), 'LATITUDE', status)
IF (status .NE. CDF_OK) CALL UserStatusHandler (status)
.
```

#### 5.11 CDF attr inquire

```
SUBROUTINE CDF attr inquire (
```

```
INTEGER*4
             id,
                                                       ! in -- CDF identifier.
INTEGER*4
             attr num,
                                                       ! in -- Attribute number.
CHARACTER attr name*(CDF ATTR NAME LEN),
                                                       ! out -- Attribute name.
                                                       ! out -- Attribute scope.
INTEGER*4
             attr scope,
                                                       ! out -- Maximum gEntry or rEntry number.
INTEGER*4
             max entry,
                                                       ! out -- Completion status
INTEGER*4
             status)
```

CDF\_attr\_inquire is used to inquire about the specified attribute. to inquire about a specific attribute entry, use CDF\_attr\_entry\_inquire (Section 5.12).

The arguments to CDF attr inquire are defined as follows:

id	The identifier of the CDF. This identifier must have been initialized by a call to CDF_create or CDF_open.
attr_num	The number of the attribute to inquire. This number may be determined with a call to CDF_attr_num (see Section 5.9).
attr_name	The attribute's name. This character string must be large enough to hold CDF_ATTR_NAME_LEN characters and will be blank padded if necessary.
attr_scope	The scope of the attribute. Attribute scopes are defined in Section 4.12.
max_entry	For gAttributes this is the maximum gEntry number used. For vAttributes this is the maximum rEntry number used. in either case this may not correspond with the number of entries (if some entry numbers were not used). The number of entries actually used may be inquired with the CDF_lib function (see Section 6). If no entries exist for the attribute, then a value of zero (0) will be passed back.

status The completion status code. Chapter 7 explains how to interpret status codes.

#### **5.11.1 Example(s)**

The following example displays the name of each attribute in a CDF. The number of attributes in the CDF is first determined using the function CDF\_inquire. Note that attribute numbers start at one (1) and are consecutive.

```
INCLUDE '<path>cdf.inc'
  INTEGER*4 id
                                       ! CDF identifier.
  INTEGER*4 status
                                       ! Returned status code.
  INTEGER*4 num dims
                                      ! Number of dimensions.
  INTEGER*4 dim sizes(CDF MAX DIMS)
                                    ! Dimension sizes (allocate to
                                       ! allow the maximum number of
                                       ! dimensions).
  INTEGER*4 encoding
                                       ! Data encoding.
  INTEGER*4 majority
                                       ! Variable majority.
  INTEGER*4 max rec
                                      ! Maximum record number in CDF.
                                      ! Number of variables in CDF.
  INTEGER*4 num vars
  INTEGER*4 num attrs
                                      ! Number of attributes in CDF.
  INTEGER*4 attr n
                                       ! Attribute number.
  CHARACTER attr_name*(CDF_ATTR_NAME_LEN)! Attribute name.
  INTEGER*4 max entry
                                        ! Maximum entry number.
  CALL CDF inquire (id, num dims, dim sizes, encoding, majority,
                   max rec, num vars, num attrs, status)
  IF (status .NE. CDF OK) CALL UserStatusHandler (status)
  DO attr n = 1, num attrs
     CALL CDF attr inquire (id, attr n, attr name, attr scope, max entry,
                           status)
     IF (status .LT. CDF OK) THEN
                                       ! INFO status codes ignored.
         CALL UserStatusHandler (status)
     ELSE
         WRITE (6,10) attr name
10
         FORMAT (' ',A)
     END IF
  END DO
```

#### 5.12 CDF attr entry inquire

```
SUBROUTINE CDF_attr_entry_inquire (
```

```
INTEGER*4 id, ! in -- CDF identifier.

INTEGER*4 attr_num, ! in -- Attribute number.

INTEGER*4 entry_num, ! in -- Entry number.

INTEGER*4 data_type, ! out -- Data type.

INTEGER*4 num_elements, ! out -- Number of elements (of the data type).

INTEGER*4 status) ! out -- Completion status
```

CDF\_attr\_entry\_inquire is used to inquire about a specific attribute entry. to inquire about the attribute in general, use CDF\_attr\_inquire (see Section 5.11). CDF\_attr\_entry\_inquire would normally be called before calling CDF\_attr\_get in order to determine the data type and number of elements (of that data type) for an entry. This would be necessary to correctly allocate enough memory to receive the value read by CDF\_attr\_get.

The arguments to CDF attr entry inquire are defined as follows:

id	The identifier of the CDF. This identifier must have been initialized by a call to CDF_create or CDF_open.
attr_num	The attribute number for which to inquire an entry. This number may be determined with a call to CDF_attr_num (see Section 5.9).
entry_num	The entry number to inquire. If the attribute is global in scope, this is simply the gEntry number and has meaning only to the application. If the attribute is variable in scope, this is the number of the associated rVariable (the rVariable being described in some way by the rEntry).
data_type	The data type of the specified entry. The data types are defined in Section 4.5.
num_elements	The number of elements of the data type. For character data types (CDF_CHAR and CDF_UCHAR), this is the number of characters in the string (an array of characters). For all other data types this is the number of elements in an array of that data type.
status	The completion status code. Chapter 7 explains how to interpret status codes.

## **5.12.1 Example(s)**

The following example inquires each entry for an attribute. Note that entry numbers need not be consecutive - not every entry number between one (1) and the maximum entry number must exist. For this reason NO\_SUCH\_ENTRY is an expected error code. Note also that if the attribute has variable scope, the entry numbers are actually rVariable numbers.

```
INCLUDE '<path>cdf.inc'
INTEGER*4 id
                                              ! CDF identifier.
INTEGER*4 status
                                              ! Returned status code.
INTEGER*4 attr n
                                              ! Attribute number.
INTEGER*4 entryN
                                              ! Entry number.
CHARACTER attr name* (CDF ATTR NAME LEN)
                                              ! Attribute name.
INTEGER*4 attr scope
                                              ! Attribute scope.
INTEGER*4 max entry
                                              ! Maximum entry number used.
INTEGER*4 data type
                                              ! Data type.
INTEGER*4 num elems
                                              ! Number of elements (of the
                                              ! data type).
attr n = CDF attr num (id, 'TMP')
IF (attr n .LT. 1) CALL UserStatusHandler (attr n) ! If less than one (1),
                                                     ! then it must be a
                                                    ! warning/error code.
CALL CDF_attr_inquire (id, attr_n, attr_name, attr_scope, max_entry, status)
IF (status .NE. CDF OK) CALL UserStatusHandler (status)
```

# 5.13 CDF\_attr\_put

SUBROUTINE CDF\_attr\_put (

```
INTEGER*4 id, ! in -- CDF identifier.

INTEGER*4 attr_num, ! in -- Attribute number.

INTEGER*4 entry_num, ! in -- Entry number.

INTEGER*4 data_type, ! in -- Data type of this entry.

INTEGER*4 num_elements, ! in -- Number of elements (of the data type).

<type> value, ! out -- Value (<type> is dependent on the data type of the enrty).

INTEGER*4 status) ! out -- Completion status
```

CDF\_attr\_put is used to write an attribute entry to a CDF. The entry may or may not already exist. If it does exist, it is overwritten. The data type and number of elements (of that data type) may be changed when overwriting an existing entry.

The arguments to CDF attr put are defined as follows:

value.

id	The identifier of the CDF. This identifier must have been initialized by a call to CDF_create or CDF_open.
attr_num	The attribute number. This number may be determined with a call to CDF_attr_num (see Section 5.9).
entry_num	The entry number. If the attribute is global in scope, this is simply the gEntry number and has meaning only to the application. If the attribute is variable in scope, this is the number of the associated rVariable (the rVariable being described in some way by the rEntry).
data_type	The data type of the specified entry. Specify one of the data types defined in Section 4.5.
num_elements	The number of elements of the data type. For character data types (CDF_CHAR and CDF_UCHAR), this is the number of characters in the string (an array of characters). For all other data types this is the number of elements in an array of that data type.
value	The value(s) to write. The entry value is written to the CDF from memory address

**WARNING:** If the entry has one of the character data types (CDF\_CHARor CDF\_UCHAR), then value must be a CHARACTER Fortran variable. If the entry does not have one of the character data types, then value must NOT be a CHARACTER Fortran variable.

status

The completion status code. Chapter 7 explains how to interpret status codes.

num elements elements of the data type data type will be written to the CDF starting from memory address value.

#### **5.13.1 Example(s)**

The following example writes two attribute entries. The first is to gEntry number one (1) of the gAttribute TITLE. The second is to the variable scope attribute VALIDs for the rEntry that corresponds to the rVariable TMP.

```
INCLUDE '<path>cdf.inc'
PARAMETER TITLE LEN = 10
                                ! Length of CDF title.
INTEGER*4 id
                                         ! CDF identifier.
INTEGER*4 status
                                          ! Returned status code.
INTEGER*4 entry_num ! Entry numce.

INTEGER*4 num_elements ! Number of elements (of data type).

CHARACTER title*(TITLE_LEN) ! Value of TITLE attribute, rEntry number 1.

! Value(s) of VALIDs attribute,

TMDValids(2) ! Value(s) of VALIDs attribute,
DATA title/'CDF title.'/, TMPvalids/15,30/
entry num = 1
CALL CDF attr put (id, CDF attr num(id, 'TITLE'), entry num, CDF CHAR,
                        TITLE LEN, title, status)
IF (status .NE. CDF OK) CALL UserStatusHandler (status)
num elements = 2
CALL CDF attr put (id, CDF attr num(id, 'VALIDs'), CDF var num(id, 'TMP'),
                        CDF INT2, num elements, TMPvalids, status)
IF (status .NE. CDF OK) CALL UserStatusHandler (status)
```

# 5.14 CDF\_attr\_get

```
SUBROUTINE CDF_attr_get (

INTEGER*4 id, ! in -- CDF identifier.
```

```
INTEGER*4 attr_num, ! in -- attribute number.

INTEGER*4 entry_num, ! in -- Entry number.

! in -- Entry number.

! out -- Value (<type> is dependent on the data type of the enrty).

INTEGER*4 status) ! out -- Completion status
```

CDF\_attr\_get is used to read an attribute entry from a CDF. In most cases it will be necessary to call CDF\_attr\_entry\_inquire before calling CDF\_attr\_get in order to determine the data type and number of elements (of that data type) for the entry.

The arguments to CDF attr get are defined as follows:

id	The identifier of the CDF. This i	dentifier must have been	initialized by a call to CDF_	create
	or CDF open.			

The attribute number. This number may be determined with a call to CDF attr num (see

attr\_num The attribute number. This number may be determined with a call to CDF\_attr\_num (see Section 5.9).

entry\_num

The entry number. If the attribute is global in scope, this is simply the gEntry number and has meaning only to the application. If the attribute is variable in scope, this is the number of the associated rVariable (the rVariable being described in some way by the rEntry).

The value read. This buffer must be large enough to hold the value. The function CDF\_attr\_entry\_inquire would be used to determine the entry data type and number of elements (of that data type). The value is read from the CDF and placed into memory at address value.

**WARNING:** If the entry has one of the character data types (CDF\_CHARor CDF\_UCHAR), then value must be a CHARACTER Fortran variable. If the entry does not have one of the character data types, then value must NOT be a CHARACTER Fortran variable.

status The completion status code. Chapter 7 explains how to interpret status codes.

#### **5.14.1 Example(s)**

value

The following example displays the value of the UNITS attribute for the rEntry corresponding to the PRES\_LVL rVariable (but only if the data type is CDF\_CHAR).

```
INCLUDE '<path>cdf.inc'
INTEGER*4 id
                           ! CDF identifier.
INTEGER*4 status
                           ! Returned status code.
INTEGER*4 attr n
                          ! Attribute number.
INTEGER*4 entryN
                          ! Entry number.
INTEGER*4 data type
                         ! Data type.
INTEGER*4 num elems
                         ! Number of elements (of data type).
                         ! Buffer to receive value (in this case it is
CHARACTER buffer*100
                           ! assumed that 100 characters is enough).
attr n = CDF attr Num (id, 'UNITS')
IF (attr n .LT. 0) CALL UserStatusHandler (attr n) ! If less than one (1),
                                                   ! then it must be a
```

```
! warning/error code.
                                                        ! The rEntry number is
   entryN = CDF var num (id, 'PRES LVL')
                                                        ! the rVariable number.
   IF (entryN .LT. 0) CALL UserStatusHandler (entryN) ! If less than one (1),
                                                        ! then it must be a
                                                        ! warning/error code.
   CALL CDF attr entry inquire (id, attr n, entryN, data type, num elems,
                                status)
   IF (status .NE. CDF OK) CALL UserStatusHandler (status)
   IF (data type .EQ. CDF CHAR) THEN

       IF (status .NE. CDF OK) CALL UserStatusHandler (status)
       WRITE (6,10) buffer(1:num elems)
10
       FORMAT (' ',A)
   END IF
```

## 5.15 CDF\_var\_create

SUBROUTINE CDF var create (

```
INTEGER*4 id,
                                    ! in -- CDF identifier.
CHARACTER var name*(*),
                                    ! in -- rVariable name.
INTEGER*4
            data_type,
                                    ! in -- Data type.
             num elements,
                                  ! in -- Number of elements (of the data type).
INTEGER*4
                                   ! in -- Record variance.
INTEGER*4
             rec variance,
            dim_variances(*),
INTEGER*4
                                  ! in -- Dimension variances.
                                    ! out -- rVariable number.
INTEGER*4
             var num,
```

CDF\_var\_create is used to create a new rVariable in a CDF. A variable (rVariable or zVariable) with the same name must not already exist in the CDF.

The arguments to CDF\_var\_create are defined as follows:

id	The identifier of the CDF. This identifier must have been initialized by a call to CDF_create or CDF_open.
var_name	The name of the rVariable to create. This may be at most CDF_VAR_NAME_LEN characters. Variable names are case-sensitive.
data_type	The data type of the new rVariable. Specify one of the data types defined in Section 4.5.
num_elements	The number of elements of the data type at each value. For character data types (CDF_CHAR and CDF_UCHAR), this is the number of characters in the string (each value consists of the entire string). For all other data types this must always be one (1) -

multiple elements at each value are not allowed for non-character data types.

rec\_variance The rVariable's record variance. Specify one of the variances defined in Section 4.9.

dim\_variances The rVariable's dimension variances. Each element of dim\_variances specifies the

corresponding dimension variance. For each dimension specify one of the variances defined in Section 4.9. For 0-dimensional rVariables this argument is ignored (but must

be present).

var\_num The number assigned to the new rVariable. This number must be used in subsequent

CDF function calls when referring to this rVariable. An existing rVariables's number

may be determined with the CDF\_var\_num function.

status The completion status code. Chapter 7 explains how to interpret status codes.

## **5.15.1 Example(s)**

The following example will create several rVariables in a CDF whose rVariables are 2-dimensional. In this case EPOCH, LAT, and LON are independent rVariables, and TMP is a dependent rVariable.

```
INCLUDE '<path>cdf.inc'
 INTEGER*4 id
                                                                                                        ! CDF identifier.
 INTEGER*4 status
                                                                                                       ! Returned status code.
 INTEGER*4 EPOCH_rec_vary
                                                                                                   ! EPOCH record variance.
! LAT record variance.

! LAT record variance.

! LAT record variance.

! LON record variance.

! INTEGER*4 TMP_rec_vary ! TMP record variance.

! INTEGER*4 EPOCH_dim_varys(2) ! EPOCH dimension variances.

! INTEGER*4 LAT_dim_varys(2) ! LAT dimension variances.

! INTEGER*4 TMP_dim_varys(2) ! TMP dimension variances.

! INTEGER*4 EPOCH_var_num | TMP_COLUMN_CALLED_CALLED_CALLED_CALLED_CALLED_CALLED_CALLED_CALLED_CALLED_CALLED_CALLED_CALLED_CALLED_CALLED_CALLED_CALLED_CALLED_CALLED_CALLED_CALLED_CALLED_CALLED_CALLED_CALLED_CALLED_CALLED_CALLED_CALLED_CALLED_CALLED_CALLED_CALLED_CALLED_CALLED_CALLED_CALLED_CALLED_CALLED_CALLED_CALLED_CALLED_CALLED_CALLED_CALLED_CALLED_CALLED_CALLED_CALLED_CALLED_CALLED_CALLED_CALLED_CALLED_CALLED_CALLED_CALLED_CALLED_CALLED_CALLED_CALLED_CALLED_CALLED_CALLED_CALLED_CALLED_CALLED_CALLED_CALLED_CALLED_CALLED_CALLED_CALLED_CALLED_CALLED_CALLED_CALLED_CALLED_CALLED_CALLED_CALLED_CALLED_CALLED_CALLED_CALLED_CALLED_CALLED_CALLED_CALLED_CALLED_CALLED_CALLED_CALLED_CALLED_CALLED_CALLED_CALLED_CALLED_CALLED_CALLED_CALLED_CALLED_CALLED_CALLED_CALLED_CALLED_CALLED_CALLED_CALLED_CALLED_CALLED_CALLED_CALLED_CALLED_CALLED_CALLED_CALLED_CALLED_CALLED_CALLED_CALLED_CALLED_CALLED_CALLED_CALLED_CALLED_CALLED_CALLED_CALLED_CALLED_CALLED_CALLED_CALLED_CALLED_CALLED_CALLED_CALLED_CALLED_CALLED_CALLED_CALLED_CALLED_CALLED_CALLED_CALLED_CALLED_CALLED_CALLED_CALLED_CALLED_CALLED_CALLED_CALLED_CALLED_CALLED_CALLED_CALLED_CALLED_CALLED_CALLED_CALLED_CALLED_CALLED_CALLED_CALLED_CALLED_CALLED_CALLED_CALLED_CALLED_CALLED_CALLED_CALLED_CALLED_CALLED_CALLED_CALLED_CALLED_CALLED_CALLED_CALLED_CALLED_CALLED_CALLED_CALLED_CALLED_CALLED_CALLED_CALLED_CALLED_CALLED_CALLED_CALLED_CALLED_CALLED_CALLED_CALLED_CALLED_CALLED_CALLED_CALLED_CALLED_CALLED_CALLED_CALLED_CALLED_CALLED_CALLED_CALLED_CALLED_CALLED_CALLED_CALLED_CALLED_CALLED_CALLED_CALLED_CALLED_CALLED_CALLED_CALLED_CALLED_CALLED_CALLED_CALLED_CALLED_CALLED_CALLED_CALLED_CALLED_CALLED_CALLED_CALLED_CALLED
 INTEGER*4 LAT var num
                                                                                                   ! LAT rVariable number.
                                                                                                    ! LON rVariable number.
 INTEGER*4 LON var num
 INTEGER*4 TMP var num
                                                                                                       ! TMP rVariable number.
 DATA EPOCH rec vary/VARY/, LAT rec vary/NOVARY/,
                LON rec vary/NOVARY/, TMP rec vary/VARY/
 DATA EPOCH dim varys/NOVARY, NOVARY/, LAT dim varys/NOVARY, VARY/,
                LON dim varys/VARY, NOVARY/, TMP dim varys/VARY, VARY/
 CALL CDF var create (id, 'EPOCH', CDF EPOCH, 1,
                                                                 EPOCH rec vary, EPOCH dim varys, EPOCH var num, status)
 IF (status .NE. CDF OK) CALL UserStatusHandler (status)
 CALL CDF var create (id, 'LATITUDE', CDF INT2, 1,
                                                                 LAT rec vary, LAT dim varys, LAT var num, status)
 IF (status .NE. CDF OK) CALL UserStatusHandler (status)
 CALL CDF var create (id, 'LONGITUDE', CDF INT2, 1,
                                                                 LON rec vary, LON dim varys, LON var num, status)
```

## 5.16 CDF var num

```
INTEGER*4 FUNCTION CDF var num (
```

```
INTEGER*4 id, ! in-- CDF identifier. CHARACTER var_name*(*)); ! in-- rVariable name.
```

CDF\_var\_num is used to determine the number associated with a given rVariable name. If the rVariable is found, CDF\_var\_num returns its number - which will be equal to or greater than one (1). If an error occurs (e.g., the rVariable does not exist in the CDF), an error code (of type INTEGER\*4) is returned. Error codes are less than zero (0).

The arguments to CDF var num are defined as follows:

id The identifier of the CDF. This identifier must have been initialized by a call to CDF\_create or CDF open.

VarName The name of the rVariable for which to search. This may be at most CDF\_VAR\_NAME\_LEN characters. Variable names are case-sensitive.

CDF\_var\_num may be used as an embedded function call when an rVariable number is needed. CDF\_var\_num is declared in cdf.inc. (Fortran functions must be declared so that the returned value is interpreted correctly.)

#### **5.16.1** Example(s)

In the following example CDF\_var\_num is used as an embedded function call when inquiring about an rVariable.

```
INCLUDE '<path>cdf.inc'
INTEGER*4 id
                                        ! CDF identifier.
INTEGER*4 status
                                        ! Returned status code.
CHARACTER var name* (CDF VAR NAME LEN)
                                       ! rVariable name.
INTEGER*4 data type
                                        ! Data type of the rVariable.
INTEGER*4 num elements
                                        ! Number of elements (of the
                                        ! data type).
INTEGER*4 rec variances
                                        ! Record variance.
                                      ! Dimension variances.
INTEGER*4 dim variances(CDF MAX DIMS)
CALL CDF var inquire (id, CDF var num(id, 'LATITUDE'), var name, data type,
                      num elements, rec variance, dim variances, status)
```

```
IF (status .NE. CDF_OK) CALL UserStatusHandler (status)
.
```

In this example the rVariable named LATITUDE was inquired. Note that if LATITUDE did not exist in the CDF, the call to CDF\_var\_num would have returned an error code. Passing that error code to CDF\_var\_inquire as an rVariable number would have resulted in CDF\_var\_inquire also returning an error code. Also note that the name written into var\_name is already known (LATITUDE). In some cases the rVariable names will be unknown - CDF\_var\_inquire would be used to determine them. CDF var inquire is described in Section 5.18.

## 5.17 CDF\_var\_rename

SUBROUTINE CDF var rename (

```
INTEGER*4 id, ! in -- CDF identifier.

INTEGER*4 var_num, ! in -- rVariable number.

CHARACTER var_name*(*), ! in -- New name.

INTEGER*4 status) ! out -- Completion status
```

CDF\_var\_rename is used to rename an existing rVariable. A variable (rVariable or zVariable) with the same name must not already exist in the CDF.

The arguments to CDF\_var\_rename are defined as follows:

```
The identifier of the CDF. This identifier must have been initialized by a call to CDF_create or CDF_open.

The number of the rVariable to rename. This number may be determined with a call to CDF_var_num (see Section 5.16).

The new rVariable name. This may be at most CDF_VAR_NAME_LEN characters. Variable names are case-sensitive.

The completion status code. Chapter 7 explains how to interpret status codes.
```

#### **5.17.1 Example(s)**

In the following example the rVariable named TEMPERATURE is renamed to TMP (if it exists). Note that if CDF\_var\_num returns a value less than one (1) then that value is not an rVariable number but rather a warning/error code.

```
.
INCLUDE '<path>cdf.inc'
.
INTEGER*4 id ! CDF identifier.
INTEGER*4 status ! Returned status code.
INTEGER*4 var_num ! rVariable number.
.
.
var_num = CDF_var_num (id, 'TEMPERATURE')
```

```
IF (var_num .LT. 1) THEN
    IF (var_num .NE. NO_SUCH_VAR) CALL UserStatusHandler (var_num)
ELSE
    CALL CDF_var_rename (id, var_num, 'TMP', status)
    IF (status .NE. CDF_OK) CALL UserStatusHandler (status)
END IF
.
.
```

# 5.18 CDF\_var\_inquire

SUBROUTINE CDF var inquire (

```
INTEGER*4
                                                      ! in -- CDF identifier.
             id,
INTEGER*4
                                                      ! in -- rVariable number.
             var num,
CHARACTER var name*(CDF VAR NAME LEN),
                                                      ! out -- rVariable name.
INTEGER*4
             data type,
                                                      ! out -- Data type.
INTEGER*4
             num elements,
                                                      ! out -- Number of elements (of the data type).
INTEGER*4
             rec variance,
                                                      ! out -- Record variance.
             dim variances(CDF MAX DIMS),
                                                      ! out -- Dimension variances.
INTEGER*4
                                                      ! out -- Completion status
INTEGER*4
             status)
```

CDF\_var\_inquire is used to inquire about the specified rVariable. This function would normally be used before reading rVariable values (with CDF\_var\_get or CDF\_var\_hyper\_get) to determine the data type and number of elements (of that data type).

The arguments to CDF var inquire are defined as follows:

id	The identifier of the CDF. This identifier must have been initialized by a call to CDF_create or CDF_open.
var_num	The number of the rVariable to inquire. This number may be determined with a call to CDF_var_num (see Section 5.16).
var_name	The rVariable's name. This character string must be large enough to hold CDF_VAR_NAME_LEN characters and will be blank padded if necessary.
data_type	The data type of the rVariable. The data types are defined in Section 4.5.
num_elements	The number of elements of the data type at each rVariable value. For character data types (CDF_CHAR and CDF_UCHAR), this is the number of characters in the string. (Each value consists of the entire string.) For all other data types, this will always be one (1) - multiple elements at each value are not allowed for non-character data types.
rec_variance	The record variance. The record variances are defined in Section 4.9.
dim_variances	The dimension variances. Each element of dim_variances receives the corresponding dimension variance. The dimension variances are defined in Section 4.9. For 0-dimensional rVariable this argument is ignored (but must be present).
status	The completion status code. Chapter 7 explains how to interpret status codes.

## **5.18.1** Example(s)

The following example inquires about an rVariable named HEAT\_FLUX in a CDF. Note that the rVariable name returned by CDF var inquire will be the same as that passed in to CDF var num.

```
INCLUDE '<path>cdf.inc'
INTEGER*4 id
                                        ! CDF identifier.
INTEGER*4 status
                                        ! Returned status code.
CHARACTER var name* (CDF VAR NAME LEN)
                                       ! rVariable name.
INTEGER*4 data type
                                        ! Data type.
INTEGER*4 num elems
                                        ! Number of elements (of data type).
INTEGER*4 rec vary
                                       ! Record variance.
INTEGER*4 dim varys(CDF MAX DIMS)
                                       ! Dimension variances (allocate to
                                        ! allow the maximum number of
                                        ! dimensions).
CALL CDF var inquire (id, CDF var num(id, 'HEAT FLUX'), var name, data type,
                      num elems, rec vary, dim varys, status)
IF (status .NE. CDF OK) CALL UserStatusHandler (status)
```

# 5.19 CDF var put

```
SUBROUTINE CDF_var_put (
```

```
INTEGER*4 id, ! in -- CDF identifier.

INTEGER*4 var_num, ! in -- rVariable number.

INTEGER*4 rec_num, ! in -- Record number.

INTEGER*4 indices(*), ! in -- Dimension indices.

<type> value, ! out -- Value (<type> is dependent on the data type of the rVariable).

INTEGER*4 status) ! out -- Completion status
```

CDF\_var\_put is used to write a single value to an rVariable. CDF\_var\_hyper\_put may be used to write more than one rVariable value with a single call (see Section 5.21).

The arguments to CDF\_var\_put are defined as follows:

id	The identifier of the CDF. This identifier must have been initialized by a call to CDF_create or CDF_open.
var_num	The number of the rVariable to which to write. This number may be determined with a call to CDF_var_num (see Section 5.16).
rec_num	The record number at which to write.

indices The array indices within the specified record at which to write. Each element of indices

specifies the corresponding dimension index. For 0-dimensional rVariables this argument is

ignored (but must be present).

value The value to write. The value is written to the CDF from memory address value.

**WARNING:** If the rVariable has one of the character data types (CDF\_CHARor CDF\_UCHAR), then value must be a CHARACTER Fortran variable. If the rVariable does not have one of the character data types, then value must NOT be a CHARACTER Fortran

variable.

status The completion status code. Chapter 7 explains how to interpret status codes.

## **5.19.1 Example(s)**

The following example writes values to the rVariable named LATITUDE in a CDF whose rVariables are 2-dimensional with dimension sizes [360,181]. For LATITUDE the record variance is NOVARY, the dimension variances are [NOVARY,VARY], and the data type is CDF INT2.

```
INCLUDE '<path>cdf.inc'
INTEGER*4 id
                           ! CDF identifier.
INTEGER*4 status
                           ! Returned status code.
INTEGER*2 lat
                           ! Latitude value.
INTEGER*4 var n
                           ! rVariable number.
                           ! Record number.
INTEGER*4 rec num
INTEGER*4 indices(2)
                           ! Dimension indices.
DATA rec num/1/, indices/1,1/
var n = CDF var num (id, 'LATITUDE')
IF (var n .LT. 1) CALL UserStatusHandler (var n)
                                                    ! If less than one (1),
                                                    ! then not an rVariable
                                                    ! number but rather a
                                                     ! warning/error code.
DO lat = -90, 90
  indices(2) = 91 + lat
  CALL CDF var put (id, var n, rec num, indices, lat, status)
  IF (status .NE. CDF OK) CALL UserStatusHandler (status)
END DO
```

Since the record variance is NOVARY, the record number (rec\_num) is set to one (1). Also note that because the dimension variances are [NOVARY, VARY], only the second dimension is varied as values are written. (The values are "virtually" the same at each index of the first dimension.)

## 5.20 CDF var get

```
SUBROUTINE CDF var get (
```

```
INTEGER*4 id, ! in -- CDF identifier.

INTEGER*4 var_num, ! in -- rVariable number.

INTEGER*4 rec_num, ! in -- Record number.

INTEGER*4 indices(*), ! in -- Dimension indices.

<type> value, ! out -- Value (<type> is dependent on the data type of the rVariable).

INTEGER*4 status) ! out -- Completion status
```

CDF\_var\_get is used to read a single value from an rVariable. CDF\_var\_hyper\_get may be used to read more than one rVariable value with a single call (see Section 5.22).

The arguments to CDF\_var\_get are defined as follows:

id The identifier of the CDF. This identifier must have been initialized by a call to CDF\_create

or CDF\_open.

var num

The number of the rVariable from which to read. This number may be determined with a

call to CDF var num (see Section 5.16).

rec num The record number at which to read.

indices The array indices within the specified record at which to read. Each element of indices

specifies the corresponding dimension index. For 0-dimensional rVariables this argument is

ignored (but must be present).

value The value read. This buffer must be large enough to hold the value. CDF var inquire

would be used to determine the rVariable's data type and number of elements (of that data type) at each value. The value is read from the CDF and placed at memory address value.

**WARNING:** If the rVariable has one of the character data types (CDF\_CHAR or

CDF\_UCHAR), then value must be a CHARACTER Fortran variable. If the rVariable does not have one of the character data types, then value must NOT be a CHARACTER Fortran

variable.

status The completion status code. Chapter 7 explains how to interpret status codes.

## **5.20.1 Example(s)**

The following example will read and hold an entire record of data from an rVariable. The CDF's rVariables are 3-dimensional with sizes [180,91,10]. For this rVariable the record variance is VARY, the dimension variances are [VARY,VARY,VARY], and the data type is CDF\_REAL4.

```
.
INCLUDE '<path>cdf.inc'
.
INTEGER*4 id ! CDF identifier.
INTEGER*4 status ! Returned status code.
REAL*4 tmp(180,91,10) ! Temperature values.
INTEGER*4 indices(3) ! Dimension indices.
INTEGER*4 var n ! rVariable number.
```

```
! Record number.
INTEGER*4 rec num

INTEGER*4 status)
                                 ! out -- Completion status
```

CDF\_var\_hyper\_put is used to write a buffer of one or more values to an rVariable. It is important to know the variable majority of the CDF before using CDF\_var\_hyper\_put because the values in the buffer to be written must be in the same majority. CDF\_inquire can be used to determine the default variable majority of a CDF distribution. The Concepts chapter in the CDF User's Guide describes the variable majorities.

The arguments to CDF var hyper put are defined as follows:

The identifier of the CDF. This identifier must have been initialized by a call to CDF\_create or CDF open.

var\_num The number of the rVariable to which to write. This number may be determined with a call to CDF\_var\_num (see Section 5.16).

rec\_start The record number at which to start writing.

rec count The number of records to write.

rec interval The interval between records for subsampling (e.g., An interval of 2 means write to every

other record).

indices The indices (within each record) at which to start writing. Each element of indices specifies

the corresponding dimension index. If there are zero (0) dimensions, this argument is ignored

(but must be present).

counts The number of values along each dimension to write. Each element of count specifies the

corresponding dimension count. For 0-dimensional rVariables this argument is ignored (but

must be present).

intervals For each dimension the interval between values for subsampling<sup>2</sup> (e.g., an interval of 2 means

write to every other value). intervals is a 1-dimensional array containing one element per rVariable dimension. Each element of intervals specifies the corresponding dimension interval. For 0-dimensional rVariables this argument is ignored (but a place holder is

necessary).

buffer The buffer of values to write. The majority of the values in this buffer must be the same as

that of the CDF. The values starting at memory address buffer are written to the CDF.

**WARNING:** If the rVariable has one of the character data types (CDF\_CHAR or CDF\_UCHAR), then value must be a CHARACTER Fortran variable. If the entry does not have one of the character data types, then value must NOT be a CHARACTER Fortran

variable.

status The completion status code. Chapter 7 explains how to interpret status codes.

#### **5.21.1** Example(s)

The following example writes values to the rVariable LATITUDE of a CDF whose rVariables are 2-dimensional with dimension sizes [360,181]. For LATITUDE the record variance is NOVARY, the dimension variances are [NOVARY,VARY], and the data type is CDF\_INT2. This example is similar to the example in Section 5.19 except that it uses a single call to CDF\_var\_hyper\_put rather than numerous calls to CDF\_var\_put.

```
INCLUDE '<path>cdf.inc'
INTEGER*4 id
                            ! CDF identifier.
INTEGER*4 status
                           ! Returned status code.
INTEGER*2 lat
                           ! Latitude value.
INTEGER*2 lats(181)
                           ! Buffer of latitude values.
INTEGER*4 var n
                           ! rVariable number.
INTEGER*4 rec start
                           ! Record number.
INTEGER*4 rec count
                           ! Record counts.
INTEGER*4 rec interval
                           ! Record interval.
INTEGER*4 indices(2)
                            ! Dimension indices.
INTEGER*4 counts(2)
                            ! Dimension counts.
```

1

<sup>&</sup>lt;sup>1</sup> "Subsampling" is not the best term to use when writing data, but you should know what we mean.

<sup>&</sup>lt;sup>2</sup> Again, not the best term.

## 5.22 CDF var hyper get

SUBROUTINE CDF\_var\_hyper\_get (

```
INTEGER*4 id.
                                ! in -- CDF identifier.
INTEGER*4 var num,
                              ! in -- rVariable number.
INTEGER*4 rec start,
                               ! in -- Starting record number.
INTEGER*4 rec count,
                              ! in -- Number of records.
INTEGER*4 rec interval,
                              ! in -- Subsampling interval between records.
INTEGER*4 indices(*),
                              ! in -- Dimension indices of starting value.
INTEGER*4 counts(*),
                               ! in -- Number of values along each dimension.
INTEGER*4 intervals(*),
                                ! in -- Subsampling intervals along each dimension.
                                ! in -- Buffer of values (<type> is dependent on the data type of the rVariable).
            buffer,
INTEGER*4 status)
                                ! out -- Completion status
```

CDF\_var\_hyper\_get is used to read a buffer of one or more values from an rVariable. It is important to know the variable majority of the CDF before using CDF\_var\_hyper\_get because the values placed into the buffer will be in that majority. CDF\_inquire can be used to determine the default variable majority of a CDF distribution. The Concepts chapter in the CDF User's Guide describes the variable majorities.

The arguments to CDF\_var\_hyper\_get are defined as follows:

id	The identifier of the CDF. This identifier must have been initialized by a call to CDF_create or CDF_open.
var_num	The number of the rVariable from which to read. This number may be determined with a call to CDF_var_num (see Section 5.16).
rec_start	The record number at which to start reading.
rec_count	The number of records to read.

rec\_interval The interval between records for subsampling (e.g., an interval of 2 means read every other

record).

indices The indices (within each record) at which to start reading. Each element of indices specifies the

corresponding dimension index. If there are zero (0) dimensions, this argument is ignored (but

must be present).

counts The number of values along each dimension to read. Each element of counts specifies the corresponding dimension count. For 0-dimensional rVariables this argument is ignored (but

must be present).

intervals For each dimension, the interval between values for subsampling (e.g., an interval of 2 means

read every other value). Each element of intervals specifies the corresponding dimension

interval. For 0-dimensional rVariables, this argument is ignored (but must be present).

buffer The buffer of values read. The majority of the values in this buffer will be the same as that of the CDF. This buffer must be large to hold the values. CDF\_var\_inquire would be used to determine the rVariable's data type and number of elements (of that data type) at each value. The

values are read from the CDF and placed into memory starting at address buffer.

**WARNING:** If the rVariable has one of the character data types (CDF\_CHAR or CDF\_UCHAR), then value must be a CHARACTER Fortran variable. If the rVariable does not have one of the character data types, then value must NOT be a CHARACTER Fortran variable.

status The completion status code. Chapter 7 explains how to interpret status codes.

## **5.22.1 Example(s)**

The following example will read an entire record of data from an rVariable. The CDF's rVariables are 3-dimensional with sizes [180,91,10] and CDF's variable majority is ROW\_MAJOR. For the rVariable the record variance is VARY, the dimension variances are [VARY,VARY,VARY], and the data type is CDF\_REAL4. This example is similar to the example in Section 5.20 except that it uses a single call to CDF\_var\_hyper\_get rather than numerous calls to CDF\_var\_get.

```
INCLUDE '<path>cdf.inc'
INTEGER*4 id
                           ! CDF identifier.
INTEGER*4 status
                           ! Returned status code.
REAL*4 tmp(180,91,10)
                          ! Temperature values.
INTEGER*4 var n
                           ! rVariable number.
INTEGER*4 rec start
                           ! Record number.
INTEGER*4 rec count
                           ! Record counts.
INTEGER*4 rec interval
                           ! Record interval.
INTEGER*4 indices(3)
                           ! Dimension indices.
INTEGER*4 counts(3)
                           ! Dimension counts.
INTEGER*4 intervals(3)
                           ! Dimension intervals.
DATA rec start/13/, rec count/1/, rec interval/1/,
     indices/1,1,1/, counts/180,91,10/, intervals/1,1,1/
var n = CDF var num (id, 'Temperature')
```

```
IF (var_n .LT. 1) CALL UserStatusHandler (var_n) ! If less than one (1), ! then it is actually a ! warning/error code.

CALL CDF_var_hyper_get (id, var_n, rec_start, rec_count, rec_interval, indices, counts, intervals, tmp, status)

IF (status .NE. CDF_OK) CALL UserStatusHandler (status)
```

Note that if the CDF's variable majority had been ROW\_MAJOR, the tmp array would have been declared REAL\*4 tmp[10][91][180] for proper indexing.

## 5.23 CDF var close

```
SUBROUTINE CDF var close (
```

```
INTEGER*4 id, ! in -- CDF identifier.

INTEGER*4 var_num, ! in -- rVariable number.

INTEGER*4 status) ! out -- Completion status
```

CDF\_var\_close is used to close an rVariable in a multi-file CDF. This function is not applicable to single-file CDFs. The use of CDF\_var\_close is not required since the CDF library automatically closes the rVariable files when a multi-file CDF is closed or when there are insufficient file pointers available (because of an open file quota) to keep all of the rVariable files open. CDF\_var\_close would be used by an application since it knows best how its rVariables are going to be accessed. Closing an rVariable would also free the cache buffers that are associated with the rVariable's file. This could be important in those situations where memory is limited (e.g., the IBM PC). The caching scheme used by the CDF library is described in the Concepts chapter in the CDF User's Guide. Note that there is not a function that opens an rVariable. The CDF library automatically opens an rVariable when it is accessed by an application (unless it is already open).

The arguments to CDF\_var\_close are defined as follows:

```
The identifier of the CDF. This identifier must have been initialized by a call to CDF_create or CDF_open.

The number of the rVariable to close. This number may be determined with a call to CDF_var_num (see Section 5.16).

The completion status code. Chapter 7 explains how to interpret status codes.
```

#### **5.23.1 Example(s)**

The following example will close an rVariable in a multi-file CDF.

```
.
INCLUDE '<path>cdf.inc'
.
INTEGER*4 id ! CDF identifier.
INTEGER*4 status ! Returned status code.
```

```
.
CALL CDF_var_close (id, CDF_var_num(id,'Flux'), status)
IF (status .NE. CDF_OK) CALL UserStatusHandler (status)
.
```

## 5.24 CDF getrvarsrecorddata

SUBROUTINE CDF getrvarsrecorddata(

```
INTEGER*4 id, ! in -- CDF identifier.

INTEGER*4 num_var ! in -- Number of rVariables.

INTEGER*4 var_nums(*) ! in -- rVariable numbers.

INTEGER*4 rec_num ! in -- Record number.

<type> buffer ! out -- First variable buffer in a common block (<type> depends on the data type of the rVariable).

INTEGER*4 status ! out -- Completion status.
```

CDF\_getrvarsrecorddata is used to read a full record data at a specific record number for a selected group of rVariables in a CDF. It expects that the data buffer for each rVariable is big enough to hold a full physical record<sup>3</sup> data and properly put in a common block. No space is needed for each rVariable's non-variant dimensional elements. Retrieved record data from the variable group is filled into respective rVariable's buffer.

The arguments to CDF\_getrvarsrecorddata are defined as follows:

id	The identifier of the CDF. This identifier must have been initialized by a call to CDFcreate, CDFopen or a similar CDF creation or opening functionality from the Internal Interface.
num_vars	The number of the rVariables in the group involved this read operation.
var_nums	The numbers of the rVariables involved for which to read a whole record data.
rec_num	The record number at which to read the whole record data for the group of rVariables.
buffer	The first variable buffer to read in a common block. The number of buffers should match to the num_var argument. Each buffer should hold a full physical record data.

## **5.24.1 Example(s)**

The following example will read an entire single record data for a group of rVariables. The CDF's rVariables are 2-dimensional with sizes [2,2]. The rVariables involved in the read are Time, Longitude, Latitude and Temperature. The record to read is 5. Since the dimension variances for Time are [NONVARY,NONVARY], a scalar variable of INTEGER\*4 is allocated for its data type CDF\_INT4. For Longitude, a 1-dimensional array of REAL\*4 is allocated as its dimension variances are [VARY,NONVARY] with data type CDF\_REAL4. A similar allocation is done for Latitude for its [NONVARY,VARY] dimension variances and CDF\_REAL4 data type. For Temperature, a 2-dimensional array of REAL\*4 is allocated due to its [VARY,VARY] dimension variances and CDF\_REAL4 data type.

\_

<sup>&</sup>lt;sup>3</sup> Physical record is explained in the Primer chapter in the CDF User's Guide.

```
INCLUDE '<path>cdf.inc'

                                 ! Number of rVariables
rec num = 5
                                 ! Record number to read
var nums(1) = CDF var num (id, 'Time')
                                         ! rVariable number
IF (var nums(1).LT. 1)
                                          ! If less than one (1),
     CALL UserStatusHandler (var nums(1))
                                                  ! then it is actually a
                                          ! warning/error code.
var nums(2) = CDF var num (id, 'Longitude')
IF (var nums(2) .LT. 1) CALL UserStatusHandler (var nums(2))
var nums(3) = CDF var num (id, 'Latitude')
IF (var nums(3) .LT. 1) CALL UserStatusHandler (var nums(3))
var nums(4) = CDF var num (id, 'Temperature')
IF (var nums(4) .LT. 1) CALL UserStatusHandler (var nums(4))
CALL CDF getrvarsrecorddata (id, num var, var nums, rec num,
                               time, status)
IF (status .NE. CDF OK) CALL UserStatusHandler (status)
```

Note that the ordering of the variable data buffer in the COMMON block BLK is very important. Always arrange data buffer in the order in such way that the variables with the bigger data types come in front of the variables with the smaller data types. They should be in this ordering: 8-byte, 4-byte, 2-byte, 1-byte. Unexpected results may return if such ordering is not followed. This function can be a replacement for the similar functionality provided from the Internal Interface as <GET, rVARs RECDATA >.

# 5.25 CDF\_putrvarsrecorddata

```
SUBROUTINE CDF_putrvarsrecorddata(

INTEGER*4 id, ! in -- CDF identifier.
```

```
INTEGER*4 num_var ! in -- Number of rVariables.

INTEGER*4 var_nums(*) ! in -- rVariable numbers.

INTEGER*4 rec_num ! in -- Record number.

<type> buffer ! in -- First variable buffer in a common block (<type> depends on the data type of the rVariable).

INTEGER*4 status ! out -- Completion status.
```

CDF\_putrvarsrecorddata is used to write a full record data at a specific record number for a selected group of rVariables in a CDF. It expects that the data buffer for each zVariable is big enough to contain a full physical record data and properly put in a common block. No space is expected for each rVariable's non-variant dimensional elements. Record data from each buffer is written to its respective rVariable.

The arguments to CDF getrvarsrecorddata are defined as follows:

id	The identifier of the CDF. This identifier must have been initialized by a call to CDFcreate, CDFopen or a similar CDF creation or opening functionality from the Internal Interface.
num_vars	The number of the rVariables in the group involved this write operation.
var_nums	The numbers of the rVariables involved for which to write a whole record data.
rec_num	The record number at which to write the whole record data for the group of rVariables.
buffer	The first variable buffer to write in a common block. The number of buffers should match to the num_var argument. Each buffer should hold a full physical record data.

## **5.25.1 Example(s)**

The following example will write an entire single record data for a group of rVariables. The CDF's rVariables are 2-dimensional with sizes [2,2]. The rVariables involved in the write are Time, Longitude, Latitude and Temperature. The record to write is 5. Since the dimension variances for Time are [NONVARY,NONVARY], a scalar variable of INTEGER\*4 is allocated for its data type CDF\_INT4. For Longitude, a 1-dimensional array of REAL\*4 is allocated as its dimension variances are [VARY,NONVARY] with data type CDF\_REAL4. A similar allocation is done for Latitude for its [NONVARY,VARY] dimension variances and CDF\_REAL4 data type. For Temperature, a 2-dimensional array of REAL\*4 is allocated due to its [VARY,VARY] dimension variances and CDF\_REAL4 data type.

```

Note that the ordering of the variable data buffer in the COMMON block BLK is very important. Always arrange data buffer in the order in such way that the variables with the bigger data types come in front of the variables with the smaller data types. They should be in this ordering: 8-byte, 4-byte, 2-byte, 1-byte. Unexpected results may return if such ordering is not followed. This function can be a replacement for the similar functionality provided from the Internal Interface as <PUT, rVARs RECDATA >.

# 5.26 CDF getzvarsrecorddata

SUBROUTINE CDF\_getzvarsrecorddata(

```
INTEGER*4 id, ! in -- CDF identifier.

INTEGER*4 num_var ! in -- Number of zVariables.

INTEGER*4 var_nums(*) ! in -- zVariable numbers.

INTEGER*4 rec_num ! in -- Record number.

<type> buffer ! out -- First variable buffer in a common block (<type> depends on the data type of the zVariable).

INTEGER*4 status ! out -- Completion status.
```

CDF\_getzvarsrecorddata is used to read a full record data at a specific record number for a selected group of zVariables in a CDF. It expects that the data buffer for each zVariable is big enough to hold a full physical record<sup>4</sup> data and properly put in a common block. No space is needed for each zVariable's non-variant dimensional elements. Retrieved record data from the variable group is filled into respective zVariable's buffer.

The arguments to CDF getzvarsrecorddata are defined as follows:

\_

<sup>&</sup>lt;sup>4</sup> Physical record is explained in the Primer chapter in the CDF User's Guide.

id	The identifier of the CDF. This identifier must have been initialized by a call to CDFcreate, CDFopen or a similar CDF creation or opening functionality from the Internal Interface.
num_vars	The number of the zVariables in the group involved this read operation.
var_nums	The numbers of the zVariables involved for which to read a whole record data.
rec_num	The record number at which to read the whole record data for the group of zVariables.
buffer	The first variable buffer to read in a common block. The number of buffers should match to the num_var argument. Each buffer should hold a full physical record data.

## **5.26.1 Example(s)**

The following example will read an entire single record data for a group of zVariables. The zVariables involved in the read are **Time**, **Longitude**, **Delta**, **Temperature** and **NAME**. The record to read is **4**. Since **Temperature** is 0-dimensional with **CDF\_FLOAT** data type, a scalar variable of REAL\*4 is allocated. For **Longitude**, a 1-dimensional array of INTEGER\*2 (size [3]) is given for its dimension variance [VARY] and data type **CDF\_INT2**. Similar data variables are provided for **Longitude** and **Time**. They both are 2-dimensional array of INTEGER\*4 (sizes [3,2]) for their dimension variances [VARY,VARY] and data type either **CDF\_INT4** or **CDF\_UINT4**. For **NAME**, a 1-dimensional array of CHARACTER\*10 (size [2]) is allocated due to its [VARY] dimension variance and **CDF\_CHAR** data type with the number of element 10.

Note that the ordering of the variable data buffer in the COMMON block BLK is very important. Always arrange data buffer in the order in such way that the variables with the bigger data types come in front of the variables with the smaller data types. They should be in this ordering: 8-byte, 4-byte, 2-byte, 1-byte. Unexpected results may return if such ordering is not followed. This function can be a replacement for the similar functionality provided from the Internal Interface as <GET, zVARs RECDATA >.

# 5.27 CDF\_putzvarsrecorddata

SUBROUTINE CDF\_putzvarsrecorddata(

```
INTEGER*4 id, ! in -- CDF identifier.

INTEGER*4 num_var ! in -- Number of zVariables.

INTEGER*4 var_nums(*) ! in -- zVariable numbers.

INTEGER*4 rec_num ! in -- Record number.

<type> buffer ! in -- First variable buffer in a common block (<type> depends on the data type of the zVariable).

INTEGER*4 status ! out -- Completion status.
```

CDF\_putzvarsrecorddata is used to write a full record data at a specific record number for a selected group of zVariables in a CDF. It expects that the data buffer for each zVariable is big enough to contain a full physical record data and properly put in a common block. No space is expected for each zVariable's non-variant dimensional elements. Record data from each buffer is written to its respective zVariable.

The arguments to CDF\_getzvarsrecorddata are defined as follows:

The identifier of the CDF. This identifier must have been initialized by a call to CDFcreate, CDFopen or a similar CDF creation or opening functionality from the Internal Interface.

The number of the zVariables in the group involved this write operation.

The numbers of the zVariables involved for which to write a whole record data.

rec\_num The record number at which to write the whole record data for the group of zVariables.

buffer The first variable buffer to write in a common block. The number of buffers should match to

the num var argument. Each buffer should hold a full physical record data.

#### **5.27.1 Example(s)**

The following example will write an entire single record data for a group of zVariables. The zVariables involved in the write are Time, Longitude, Delta, Temperature and NAME. The record to write is 4. Since Temperature is 0-dimensional with CDF\_FLOAT data type, a scalar variable of REAL\*4 is allocated. For Longitude, a 1-dimensional array of INTEGER\*2 (size [3]) is given for its dimension variance [VARY] and data type CDF\_INT2. Similar data variables are provided for Longitude and Time. They both are 2-dimensional array of INTEGER\*4 (sizes [3,2]) for their dimension variances [VARY,VARY] and data type either CDF\_INT4 or CDF\_UINT4. For NAME, a 1-dimensional array of CHARACTER\*10 (size [2]) is allocated due to its [VARY] dimension variance and CDF\_CHAR data type with the number of element 10.

Note that the ordering of the variable data buffer in the COMMON block BLK is very important. Always arrange data buffer in the order in such way that the variables with the bigger data types come in front of the variables with the smaller data types. They should be in this ordering: 8-byte, 4-byte, 2-byte, 1-byte. Unexpected results may return if such ordering is not followed. This function can be a replacement for the similar functionality provided from the Internal Interface as <PUT\_, zVARs\_RECDATA\_>.

# Chapter 6

# Internal Interface – CDF\_lib

The Internal interface consists of only one routine, CDF\_lib.¹ CDF\_lib can be used to perform all possible operations on a CDF. In fact, all of the Standard Interface functions are implemented using the Internal Interface. CDF\_lib must be used to perform operations not possible with the Standard Interface functions. These operations would involve CDF features added after the Standard Interface functions had been defined (e.g., specifying a single-file format for a CDF, accessing zVariables, or specifying a pad value for an rVariable or zVariable). Note that CDF\_lib can also be used to perform certain operations more efficiently than with the Standard Interface functions.

CDF\_lib takes a variable number of arguments that specify one or more operations to be performed (e.g., opening a CDF, creating an attribute, or writing a variable value). The operations are performed according to the order of the arguments. Each operation consists of a function being performed on an item. An item may be either an object (e.g., a CDF, variable, or attribute) or a state (e.g., a CDF's format, a variable's data specification, or a CDF's current attribute). The possible functions and corresponding items (on which to perform those functions) are described in Section 6.6.

# 6.1 Example(s)

The easiest way to explain how to use CDF\_lib would be to start with a few examples. The following example shows how a CDF would be created with the single-file format (assuming multi-file is the default).

```
INCLUDE '<path>cdf.inc'
INTEGER*4 id
                          ! CDF identifier.
INTEGER*4 status
                          ! Returned status code.
                        ! Name of the CDF.
CHARACTER CDF name*5
INTEGER*4 num dims
                         ! Number of dimensions.
INTEGER*4 dim sizes(2)
                         ! Dimension sizes.
INTEGER*4 encoding
                         ! Data encoding.
INTEGER*4 majority
                          ! Variable data majority.
INTEGER*4 format
                          ! Format of CDF.
DATA CDF name/'test1'/, num dims/2/, dim sizes/100,200/,
```

See section 6.5.1 for an ugly exception to this.

The call to CDF\_create created the CDF as expected but with a format of multi-file (assuming that is the default). The call to CDF\_lib is then used to change the format to single-file (which must be done before any variables are created in the CDF).

The arguments to CDF lib in this example are explained as follows:

PUT\_ The first function to be performed. in this case An item is going to be put to the "current" CDF (a new format). PUT\_ is defined in cdf.inc (as are all CDF constants). It was not necessary to select a current CDF since the call to CDF\_create implicitly selected the CDF created as the current CDF.<sup>2</sup> This is the case since all of the Standard Interface functions actually call the Internal Interface to perform their operations.

CDF\_FORMAT The item to be put. In this case it is the CDF's format.

format The actual format for the CDF. Depending on the item being put, one or more arguments would have been necessary. In this case only one argument is necessary.

This argument could have been one of two things. It could have been another item to put (followed by the arguments required for that item) or it could have been a new function to perform. In this case it is a new function to perform - the NULL\_function. NULL\_indicates the end of the call to CDF\_lib. Specifying NULL\_at the end of the argument list is required because not all compilers/operating systems provide the ability for a called function to determine how many arguments were passed in by the calling function.

The completion status code. Note that CDF\_lib also returns the completion status code.<sup>3</sup> Chapter 7 explains how to interpret status codes.

The next example shows how the same CDF could have been created using only one call to CDF\_lib. (The declarations would be the same.)

```
status = CDF_lib (CREATE_, CDF_, CDF_name, num_dims, dim_sizes, id,

PUT_, CDF_ENCODING_, encoding,

CDF_MAJORITY_, majority,

CDF_FORMAT_, format,

NULL_, status)
```

62

NULL

status

<sup>&</sup>lt;sup>2</sup> In previous releases of CDF, it was required that the current CDF be selected in each call to CDF\_lib. That requirement has been eliminated. The CDF library now maintains the current CDF from one call to the next of CDF lib.

<sup>&</sup>lt;sup>3</sup> Section 6.5 explains why it does both.

```
IF (status .NE. CDF OK) CALL UserStatusHandler (status)
```

.

The purpose of each argument is as follows:

CREATE The first function to be performed. In this case something will be created.

CDF The item to be created - a CDF in this case. There are four required arguments that

must follow. When a CDF is created (with CDF\_lib), the format, encoding, and majority default to values specified when your CDF distribution was built and

installed. Consult your system manager for these defaults.

CDF name The file name of the CDF.

num dims

The number of dimensions in the CDF.

dim sizes The dimension sizes.

id The identifier to be used when referencing the created CDF in subsequent

operations.

PUT This argument could have been one of two things. Another item to create or a new

function to perform. In this case it is another function to perform - something will

be put to the CDF.

CDF ENCODING

The item to be put - in this case the CDF's encoding. Note that the CDF did not

have to be selected. It was implicitly selected as the current CDF when it was

created.

encoding The encoding to be put to the CDF.

CDF MAJORITY This argument could have been one of two things. Another item to put or a new

function to perform. In this case it is another item to put - the CDF's majority.

majority The majority to be put to the CDF.

CDF\_FORMAT\_ Once again this argument could have been either another item to put or a new

function to perform. It is another item to put - the CDF's format.

format The format to be put to the CDF.

NULL This argument could have been either another item to put or a new function to

perform. Here it is another function to perform - the NULL function that ends the

call to CDF\_lib.

status The completion status code. Note that CDF lib also returns the completion status

code. Chapter 7 explains how to interpret status codes.

Note that the operations are performed in the order that they appear in the argument list. The CDF had to be created before the encoding, majority, and format could be specified (put).

# 6.2 Current Objects/States (Items)

The use of CDF\_lib requires that an application be aware of the current objects/states maintained by the CDF library. The following current objects/states are used by the CDF library when performing operations.

#### CDF (object)

A CDF operation is always performed on the current CDF. The current CDF is implicitly selected whenever a CDF is opened or created. The current CDF may be explicitly selected using the <SELECT\_,CDF\_>4 operation. There is no current CDF until one is opened or created (which implicitly selects it) or until one is explicitly selected.<sup>5</sup>

#### rVariable (object)

An rVariable operation is always performed on the current rVariable in the current CDF. For each open CDF a current rVariable is maintained. This current rVariable is implicitly selected when an rVariable is created (in the current CDF) or it may be explicitly selected with the <SELECT\_,rVAR\_> or <SELECT\_,rVAR\_NAME\_> operations. There is no current rVariable in a CDF until one is created (which implicitly selects it) or until one is explicitly selected.

#### zVariable (object)

A zVariable operation is always performed on the current zVariable in the current CDF. For each open CDF a current zVariable is maintained. This current zVariable is implicitly selected when a zVariable is created (in the current CDF) or it may be explicitly selected with the <SELECT\_,zVAR\_> or <SELECT\_,zVAR\_NAME\_> operations. There is no current zVariable in a CDF until one is created (which implicitly selects it) or until one is explicitly selected.

#### attribute (object)

An attribute operation is always performed on the current attribute in the current CDF. For each open CDF a current attribute is maintained. This current attribute is implicitly selected when an attribute is created (in the current CDF) or it may be explicitly selected with the <SELECT\_,ATTR\_> or <SELECT\_,ATTR\_NAME\_> operations. There is no current attribute in a CDF until one is created (which implicitly selects it) or until one is explicitly selected.

#### gEntry number (state)

A gAttribute gEntry operation is always performed on the current gEntry number in the current CDF for the current attribute in that CDF. For each open CDF a current gEntry number is maintained. This current gEntry number must be explicitly selected with the <SELECT\_,gENTRY\_> operation. (There is no implicit or default selection of the current gEntry number for a CDF.) Note that the current gEntry number is maintained for the CDF (not each attribute) - it applies to all of the attributes in that CDF.

## rEntry number (state)

A vAttribute rEntry operation is always performed on the current rEntry number in the current CDF for the current attribute in that CDF. For each open CDF a current rEntry number is maintained. This current rEntry number must be explicitly selected with the <SELECT\_,rENTRY\_> operation. (There is no implicit or default selection of the current rEntry number for a CDF.) Note that the current rEntry number is maintained for the CDF (not each attribute) - it applies to all of the attributes in that CDF.

#### zEntry number (state)

A vAttribute zEntry operation is always performed on the current zEntry number in the current CDF for the current attribute in that CDF. For each open CDF a current zEntry number is maintained. This current zEntry number must be explicitly selected with the <SELECT ,zENTRY > operation. (There is no implicit or default

<sup>&</sup>lt;sup>4</sup> This notation is used to specify a function to be performed on an item. The syntax is <function\_,item\_>.

<sup>&</sup>lt;sup>5</sup> In previous releases of CDF, it was required that the current CDF be selected in each call to CDF\_lib. That requirement no longer exists. The CDF library now maintains the current CDF from one call to the next of CDF\_lib.

selection of the current zEntry number for a CDF.) Note that the current zEntry number is maintained for the CDF (not each attribute) - it applies to all of the attributes in that CDF.

#### record number, rVariables (state)

An rVariable read or write operation is always performed at (for single and multiple variable reads and writes) or starting at (for hyper reads and writes) the current record number for the rVariables in the current CDF. When a CDF is opened or created, the current record number for its rVariables is initialized to zero (0). It may then be explicitly selected using the <SELECT\_,rVARs\_RECNUMBER\_> operation. Note that the current record number for rVariables is maintained for a CDF (not each rVariable) - it applies to all of the rVariables in that CDF.

#### record count, rVariables (state)

An rVariable hyper read or write operation is always performed using the current record count for the rVariables in the current CDF. When a CDF is opened or created, the current record count for its rVariables is initialized to one (1). It may then be explicitly selected using the <SELECT\_,rVARs\_RECCOUNT\_> operation. Note that the current record count for rVariables is maintained for a CDF (not each rVariable) - it applies to all of the rVariables in that CDF.

#### record interval, rVariables (state)

An rVariable hyper read or write operation is always performed using the current record interval for the rVariables in the current CDF. When a CDF is opened or created, the current record interval for its rVariables is initialized to one (1). It may then be explicitly selected using the <SELECT\_,rVARs\_RECINTERVAL\_> operation. Note that the current record interval for rVariables is maintained for a CDF (not each rVariable) - it applies to all of the rVariables in that CDF.

#### dimension indices, rVariables (state)

An rVariable read or write operation is always performed at (for single reads and writes) or starting at (for hyper reads and writes) the current dimension indices for the rVariables in the current CDF. When a CDF is opened or created, the current dimension indices for its rVariables are initialized to zeroes (0,0,...). They may then be explicitly selected using the <SELECT\_,rVARs\_DIMINDICES\_> operation. Note that the current dimension indices for rVariables are maintained for a CDF (not each rVariable) - they apply to all of the rVariables in that CDF. For 0-dimensional rVariables the current dimension indices are not applicable.

#### dimension counts, rVariables (state)

An rVariable hyper read or write operation is always performed using the current dimension counts for the rVariables in the current CDF. When a CDF is opened or created, the current dimension counts for its rVariables are initialized to the dimension sizes of the rVariables (which specifies the entire array). They may then be explicitly selected using the <SELECT\_,rVARs\_DIMCOUNTS\_> operation. Note that the current dimension counts for rVariables are maintained for a CDF (not each rVariable) - they apply to all of the rVariables in that CDF. For 0-dimensional rVariables the current dimension counts are not applicable.

#### dimension intervals, rVariables (state)

An rVariable hyper read or write operation is always performed using the current dimension intervals for the rVariables in the current CDF. When a CDF is opened or created, the current dimension intervals for its rVariables are initialized to ones (1,1,...). They may then be explicitly selected using the  $\langle SELECT\_,rVARs\_DIMINTERVALS\_ \rangle$  operation. Note that the current dimension intervals for rVariables are maintained for a CDF (not each rVariable) - they apply to all of the rVariables in that CDF. For 0-dimensional rVariables the current dimension intervals are not applicable.

#### sequential value, rVariable (state)

An rVariable sequential read or write operation is always performed at the current sequential value for that rVariable. When an rVariable is created (or for each rVariable in a CDF being opened), the current sequential value is set to the first physical value (even if no physical values exist yet). It may then be explicitly selected using the <SELECT\_,rVAR\_SEQPOS\_> operation. Note that a current sequential value is maintained for each rVariable in a CDF.

#### record number, zVariable (state)

A zVariable read or write operation is always performed at (for single reads and writes) or starting at (for hyper reads and writes) the current record number for the current zVariable in the current CDF. A multiple variable read or write operation is performed at the current record number of each of the zVariables involved. (The record numbers do not have to be the same.) When a zVariable is created (or for each zVariable in a CDF being opened), the current record number for that zVariable is initialized to zero (0). It may then be explicitly selected using the <SELECT\_,zVAR\_RECNUMBER\_> operation (which only affects the current zVariable in the current CDF). Note that a current record number is maintained for each zVariable in a CDF.

#### record count, zVariable (state)

A zVariable hyper read or write operation is always performed using the current record count for the current zVariable in the current CDF. When a zVariable created (or for each zVariable in a CDF being opened), the current record count for that zVariable is initialized to one (1). It may then be explicitly selected using the <SELECT\_,zVAR\_RECCOUNT\_> operation (which only affects the current zVariable in the current CDF). Note that a current record count is maintained for each zVariable in a CDF.

#### record interval, zVariable (state)

A zVariable hyper read or write operation is always performed using the current record interval for the current zVariable in the current CDF. When a zVariable is created (or for each zVariable in a CDF being opened), the current record interval for that zVariable is initialized to one (1). It may then be explicitly selected using the <SELECT\_,zVAR\_RECINTERVAL\_> operation (which only affects the current zVariable in the current CDF). Note that a current record interval is maintained for each zVariable in a CDF.

#### dimension indices, zVariable (state)

A zVariable read or write operation is always performed at (for single reads and writes) or starting at (for hyper reads and writes) the current dimension indices for the current zVariable in the current CDF. When a zVariable is created (or for each zVariable in a CDF being opened), the current dimension indices for that zVariable are initialized to zeroes (0,0,...). They may then be explicitly selected using the <SELECT\_,zVAR\_DIMINDICES\_> operation (which only affects the current zVariable in the current CDF). Note that current dimension indices are maintained for each zVariable in a CDF. For 0-dimensional zVariables the current dimension indices are not applicable.

#### dimension counts, zVariable (state)

A zVariable hyper read or write operation is always performed using the current dimension counts for the current zVariable in the current CDF. When a zVariable is created (or for each zVariable in a CDF being opened), the current dimension counts for that zVariable are initialized to the dimension sizes of that zVariable (which specifies the entire array). They may then be explicitly selected using the <SELECT\_,zVAR\_DIMCOUNTS\_> operation (which only affects the current zVariable in the current CDF). Note that current dimension counts are maintained for each zVariable in a CDF. For 0-dimensional zVariables the current dimension counts are not applicable.

#### dimension intervals, zVariable (state)

A zVariable hyper read or write operation is always performed using the current dimension intervals for the current zVariable in the current CDF. When a zVariable is created (or for each zVariable in a CDF being opened), the current dimension intervals for that zVariable are initialized to ones (1,1,...). They may then be explicitly selected using the <SELECT\_,zVAR\_DIMINTERVALS\_> operation (which only affects the current zVariable in the current CDF). Note that current dimension intervals are maintained for each zVariable in a CDF. For 0-dimensional zVariables the current dimension intervals are not applicable.

#### sequential value, zVariable (state)

A zVariable sequential read or write operation is always performed at the current sequential value for that zVariable. When a zVariable is created (or for each zVariable in a CDF being opened), the current sequential value is set to the first physical value (even if no physical values exist yet). It may then be explicitly selected using the <SELECT\_,zVAR\_SEQPOS\_> operation. Note that a current sequential value is maintained for each zVariable in a CDF.

status code (state)

When inquiring the explanation of a CDF status code, the text returned is always for the current status code. One current status code is maintained for the entire CDF library (regardless of the number of open CDFs). The current status code may be selected using the <SELECT\_,CDF\_STATUS\_> operation. There is no default current status code. Note that the current status code is NOT the status code from the last operation performed.<sup>6</sup>

## 6.3 Returned Status

CDF\_lib returns a status code of type INTEGER\*4 in the last argument given. Since more than one operation may be performed with a single call to CDF\_lib, the following rules apply:

- 1. The first error detected aborts the call to CDF lib, and the corresponding status code is returned.
- 2. In the absence of any errors, the status code for the last warning detected is returned.
- 3. In the absence of any errors or warnings, the status code for the last informational condition is returned.
- 4. In the absence of any errors, warnings, or informational conditions, CDF OK is returned.

Chapter 7 explains how to interpret status codes. Appendix A lists the possible status codes and the type of each: error, warning, or informational.

## 6.4 Indentation/Style

Indentation should be used to make calls to CDF\_lib readable. The following example shows a call to CDF\_lib using proper indentation.

```
status = CDF_lib (CREATE_, CDF_, CDF_name, num_dims, dim_sizes, id,

PUT_, CDF_FORMAT_, format,

CDF_MAJORITY_, majority,

CREATE_, ATTR_, attr_name, scope, attr_num,

rVAR_, var_name, data_type, num_elements,

rec_vary, dim_varys, var_num,

NULL , status)
```

Note that the functions (CREATE, PUT\_, and NULL\_) are indented the same and that the items (CDF\_, CDF\_FORMAT\_, CDF\_MAJORITY\_, ATTR\_, and rVAR\_) are indented the same under their corresponding functions.

The following example shows the same call to CDF\_lib without the proper indentation.

```
status = CDF_lib (CREATE_, CDF_, CDF_name, num_dims, dim_sizes, id, PUT_,

CDF_FORMAT_, format, CDF_MAJORITY_, majority, CREATE_,

ATTR_, attr_name, scope, attr_num, rVAR_, var_name,

data_type, num_elements, rec_vary, dim_varys, var_num,

NULL_, status)
```

<sup>&</sup>lt;sup>6</sup> The CDF library now maintains the current status code from one call to the next of CDF\_lib.

<sup>&</sup>lt;sup>7</sup> CDF\_lib has been changed from a subroutine to a function and now also returns the status code.

The need for proper indentation to ensure the readability of your applications should be obvious.

## 6.5 Syntax

CDF\_lib takes a variable number of arguments. There must always be at least one argument. The maximum number of arguments is not limited by CDF but rather the Fortran compiler and operating system being used. Under normal circumstances that limit would never be reached (or even approached). Note also that a call to CDF\_lib with a large number of arguments can always be broken up into two or more calls to CDF\_lib with fewer arguments.

The syntax for CDF\_lib is as follows:

where fncx is a function to perform, itemx is the item on which to perform the function, and argx is a required argument for the operation. The NULL\_function must be used to end the call to CDF\_lib. The completion status, status, is returned.

Previously, CDF\_lib was a subroutine. It was changed to a function which returns the completion status code (and still stores it in the last argument) to ease the debugging of calls to CDF\_lib. If in a call to CDF lib an unknown function or item is specified, or if an operation's argument is missing, the status argument would never be reached (and BAD\_FNC\_OR\_ITEM would not be stored). By returning the completion status code this situation should not occur. Note that the same Fortran variable can be used to receive the status code and as the last argument in the call to CDF\_lib.

#### 6.5.1 Macintosh, MPW Fortran

The MPW Fortran compiler does not allow variable length argument lists such as those used by CDF\_lib. For that reason, a number of additional Internal Interface functions are available named CDF lib 4, CDF lib 5, etc. Each of

<sup>8</sup> Current applications do not have to be changed because the completion status code is still stored in the last argument.

<sup>&</sup>lt;sup>9</sup> If you know of a way to make MPW Fortran accept variable length argument lists, by all means let us know. We don't like having to do this any more than you do.

these functions expects the number of arguments indicated by their names. The maximum number of arguments is at least 25 (corresponding to CDF\_lib\_25) but can be increased if necessary by contacting CDF support. Using these functions, the second example shown in this section would be as follows:

```
status = CDF_lib_15 (CREATE_, CDF_, CDF_name, num_dims, dim_sizes, id,

PUT_, CDF_ENCODING_, encoding,

CDF_MAJORITY_, majority,

CDF_FORMAT_, format,

NULL_, status)

IF (status .NE. CDF_OK) CALL UserStatusHandler (status)

...
```

Note that CDF lib may still be used but with the same number of arguments for each occurrence.

## 6.6 Operations...

An operation consists of a function being performed on an item. The supported functions are as follows:

CLOSE_	Used to close an item.
CONFIRM_	Used to confirm the value of an item.
CREATE_	Used to create an item.
DELETE_	Used to delete an item.
GET_	Used to get (read) something from an item.
NULL_	Used to signal the end of the argument list of an internal interface call.
OPEN_	Used to open an item.
PUT_	Used to put (write) something to an item.
SELECT_	Used to select the value of an item.

For each function the supported items, required arguments, and required preselected objects/states are listed below. The required preselected objects/states are those objects/states that must be selected (typically with the SELECT\_function) before a particular operation may be performed. Note that some of the required preselected objects/states have default values as described at Section 6.2.

```
<CLOSE ,CDF >
```

Closes the current CDF. When the CDF is closed, there is no longer a current CDF. A CDF must be closed to ensure that it will be properly written to disk.

There are no required arguments.

The only required preselected object/state is the current CDF.

```
<CLOSE ,rVAR >
```

Closes the current rVariable (in the current CDF). This operation is only applicable to multi-file CDFs.

There are no required arguments.

The required preselected objects/states are the current CDF and its current rVariable.

```
<CLOSE_,zVAR_>
```

Closes the current zVariable (in the current CDF). This operation is only applicable to multi-file CDFs.

There are no required arguments.

The required preselected objects/states are the current CDF and its current zVariable.

#### <CONFIRM ,ATTR >

Confirms the current attribute (in the current CDF). Required arguments are as follows:

out: INTEGER\*4 attr\_num

Attribute number.

The only required preselected object/state is the current CDF.

#### <CONFIRM ,ATTR EXISTENCE >

Confirms the existence of the named attribute (in the current CDF). If the attribute does not exist, an error code will be returned in any case the current attribute is not affected. Required arguments are as follows:

in: CHARACTER attr name\*(\*)

The attribute name. This may be at most CDF\_ATTR\_NAME\_LEN characters.

The only required preselected object/state is the current CDF.

#### <CONFIRM ,CDF >

Confirms the current CDF. Required arguments are as follows:

out: INTEGER\*4 id

The current CDF.

There are no required preselected objects/states.

#### <CONFIRM ,CDF ACCESS >

Confirms the accessability of the current CDF. If a fatal error occurred while accessing the CDF the error code NO\_MORE\_ACCESS will be returned. If this is the case, the CDF should still be closed.

There are no required arguments.

The only required preselected object/state is the current CDF.

#### <CONFIRM ,CDF CACHESIZE >

Confirms the number of cache buffers being used for the dotCDF file (for the current CDF). The Concepts chapter in the CDF User's Guide describes the caching scheme used by the CDF library. Required arguments are as follows:

out: INTEGER\*4 num\_buffers

The number of cache buffers being used.

The only required preselected object/state is the current CDF.

#### <CONFIRM ,CDF DECODING >

Confirms the decoding for the current CDF. Required arguments are as follows:

out: INTEGER\*4 decoding

The decoding. The decodings are described in Section 4.7.

The only required preselected object/state is the current CDF.

### <CONFIRM\_,CDF\_NAME\_>

Confirms the file name of the current CDF. Required arguments are as follows:

out: CHARACTER CDF name\*(CDF PATHNAME LEN)

File name of the CDF.

The only required preselected object/state is the current CDF.

#### <CONFIRM ,CDF NEGtoPOSfp0 MODE >

Confirms the -0.0 to 0.0 mode for the current CDF. Required arguments are as follows:

out: INTEGER\*4 mode

The -0.0 to 0.0 mode. The -0.0 to 0.0 modes are described in Section 4.15.

The only required preselected object/state is the current CDF.

## <CONFIRM ,CDF READONLY MODE >

Confirms the read-only mode for the current CDF. Required arguments are as follows:

out: INTEGER\*4 mode

The read-only mode. The read-only modes are described in Section 4.13.

The only required preselected object/state is the current CDF.

## <CONFIRM ,CDF STATUS >

Confirms the current status code. Note that this is not the most recently returned status code but rather the most recently selected status code (see the <SELECT, CDF STATUS > operation).

Required arguments are as follows:

out: INTEGER\*4 status

The status code.

The only required preselected object/state is the current status code.

#### <CONFIRM ,zMODE >

Confirms the zMode for the current CDF. Required arguments are as follows:

out: INTEGER\*4 mode

The zMode. The zModes are described in Section 4.14.

The only required preselected object/state is the current CDF.

## <CONFIRM ,COMPRESS CACHESIZE >

Confirms the number of cache buffers being used for the compression scratch file (for the current CDF). The Concepts chapter in the CDF User's Guide describes the caching scheme used by the CDF library. Required arguments are as follows:

out: INTEGER\*4 num buffers

The number of cache buffers being used.

The only required preselected object/state is the current CDF.

## <CONFIRM ,CURGENTRY EXISTENCE >

Confirms the existence of the gEntry at the current gEntry number for the current attribute (in the current CDF). If the gEntry does not exist, an error code will be returned.

There are no required arguments.

The required preselected objects/states are the current CDF, its current attribute, and its current gEntry number.

**NOTE:** Only use this operation on gAttributes. An error will occur if used on a vAttribute.

## <CONFIRM\_,CURrENTRY\_EXISTENCE\_>

Confirms the existence of the rEntry at the current rEntry number for the current attribute (in the current CDF). If the rEntry does not exist, an error code will be returned.

There are no required arguments.

The required preselected objects/states are the current CDF, its current attribute, and its current rEntry number.

NOTE: Only use this operation on vAttributes. An error will occur if used on a gAttribute.

#### <CONFIRM ,CURZENTRY EXISTENCE >

Confirms the existence of the zEntry at the current zEntry number for the current attribute (in the current CDF). If the zEntry does not exist, an error code will be returned.

There are no required arguments.

The required preselected objects/states are the current CDF, its current attribute, and its current zEntry number.

**NOTE:** Only use this operation on vAttributes. An error will occur if used on a gAttribute.

### <CONFIRM\_,gENTRY\_>

Confirms the current gEntry number for all attributes in the current CDF. Required arguments are as follows:

out: INTEGER\*4 entry num

The gEntry number.

The only required preselected object/state is the current CDF.

#### <CONFIRM ,gENTRY EXISTENCE >

Confirms the existence of the specified gEntry for the current attribute (in the current CDF). If the gEntry does not exist, an error code will be returned. in any case the current gEntry number is not affected. Required arguments are as follows:

in: INTEGER\*4 entry\_num

The gEntry number.

The required preselected objects/states are the current CDF and its current attribute.

**NOTE:** Only use this operation on gAttributes. An error will occur if used on a vAttribute.

## <CONFIRM ,rENTRY >

Confirms the current rEntry number for all attributes in the current CDF. Required arguments are as follows:

out: INTEGER\*4 entry num

The rEntry number.

The only required preselected object/state is the current CDF.

#### <CONFIRM ,rENTRY EXISTENCE >

Confirms the existence of the specified rEntry for the current attribute (in the current CDF). If the rEntry does not exist, An error code will be returned in any case the current rEntry number is not affected. Required arguments are as follows:

in: INTEGER\*4 entry num

The rEntry number.

The required preselected objects/states are the current CDF and its current attribute.

**NOTE:** Only use this operation on vAttributes. An error will occur if used on a gAttribute.

#### <CONFIRM ,rVAR >

Confirms the current rVariable (in the current CDF). Required arguments are as follows:

out: INTEGER\*4 var num

rVariable number.

The only required preselected object/state is the current CDF.

## <CONFIRM ,rVAR CACHESIZE >

Confirms the number of cache buffers being used for the current rVariable's file (of the current CDF). This operation is not applicable to a single-file CDF. The Concepts chapter in the CDF User's Guide describes the caching scheme used by the CDF library. Required arguments are as follows:

out: INTEGER\*4 num buffers

The number of cache buffers being used.

The required preselected objects/states are the current CDF and its current rVariable.

# <CONFIRM\_,rVAR\_EXISTENCE\_>

Confirms the existence of the named rVariable (in the current CDF). If the rVariable does not exist, an error code will be returned. in any case the current rVariable is not affected. Required arguments are as follows:

in: CHARACTER var name\*(\*)

The rVariable name. This may be at most CDF\_VAR\_NAME\_LEN characters.

The only required preselected object/state is the current CDF.

<CONFIRM ,rVAR PADVALUE >

Confirms the existence of an explicitly specified pad value for the current rVariable (in the current CDF). If An explicit pad value has not been specified, the informational status code NO\_PADVALUE\_SPECIFIED will be returned.

There are no required arguments.

The required preselected objects/states are the current CDF and its current rVariable.

## <CONFIRM ,rVAR RESERVEPERCENT >

Confirms the reserve percentage being used for the current rVariable (of the current CDF). This operation is only applicable to compressed rVariables. The Concepts chapter in the CDF User's Guide describes the reserve percentage scheme used by the CDF library. Required arguments are as follows:

out: INTEGER\*4 percent

The reserve percentage.

The required preselected objects/states are the current CDF and its current rVariable.

## <CONFIRM ,rVAR SEQPOS >

Confirms the current sequential value for sequential access for the current rVariable (in the current CDF). Note that a current sequential value is maintained for each rVariable individually. Required arguments are as follows:

out: INTEGER\*4 rec num

Record number.

out: INTEGER\*4 indices(CDF\_MAX\_DIMS)

Dimension indices. Each element of indices receives the corresponding dimension index. For 0-dimensional rVariables this argument is ignored (but must be present).

The required preselected objects/states are the current CDF and its current rVariable.

#### <CONFIRM .rVARs DIMCOUNTS >

Confirms the current dimension counts for all rVariables in the current CDF. For 0-dimensional rVariables this operation is not applicable. Required arguments are as follows:

out: INTEGER\*4 counts(CDF MAX DIMS)

Dimension counts. Each element of counts receives the corresponding dimension count.

The only required preselected object/state is the current CDF.

#### <CONFIRM ,rVARs DIMINDICES >

Confirms the current dimension indices for all rVariables in the current CDF. For 0-dimensional rVariables this operation is not applicable. Required arguments are as follows:

out: INTEGER\*4 indices(CDF MAX DIMS)

Dimension indices. Each element of indices receives the corresponding dimension index.

The only required preselected object/state is the current CDF.

<CONFIRM\_,rVARs\_DIMINTERVALS\_>

Confirms the current dimension intervals for all rVariables in the current CDF. For 0-dimensional rVariables this operation is not applicable. Required arguments are as follows:

out: INTEGER\*4 intervals(CDF MAX DIMS)

Dimension intervals. Each element of intervals receives the corresponding dimension interval.

The only required preselected object/state is the current CDF.

## <CONFIRM ,rVARs RECCOUNT >

Confirms the current record count for all rVariables in the current CDF. Required arguments are as follows:

out: INTEGER\*4 rec count

Record count.

The only required preselected object/state is the current CDF.

#### <CONFIRM ,rVARs RECINTERVAL >

Confirms the current record interval for all rVariables in the current CDF. Required arguments are as follows:

out: INTEGER\*4 rec\_interval

Record interval.

The only required preselected object/state is the current CDF.

### <CONFIRM ,rVARs RECNUMBER >

Confirms the current record number for all rVariables in the current CDF. Required arguments are as follows:

out: INTEGER\*4 rec\_num

Record number.

The only required preselected object/state is the current CDF.

## <CONFIRM ,STAGE CACHESIZE >

Confirms the number of cache buffers being used for the staging scratch file (for the current CDF). The Concepts chapter in the CDF User's Guide describes the caching scheme used by the CDF library. Required arguments are as follows:

out: INTEGER\*4 num\_buffers

The number of cache buffers being used.

The only required preselected object/state is the current CDF.

## <CONFIRM ,zENTRY >

Confirms the current zEntry number for all attributes in the current CDF. Required arguments are as follows:

out: INTEGER\*4 entry num

The zEntry number.

The only required preselected object/state is the current CDF.

## <CONFIRM ,zENTRY EXISTENCE >

Confirms the existence of the specified zEntry for the current attribute (in the current CDF). If the zEntry does not exist, an error code will be returned in any case the current zEntry number is not affected. Required arguments are as follows:

in: INTEGER\*4 entry\_num

The zEntry number.

The required preselected objects/states are the current CDF and its current attribute.

**NOTE:** Only use this operation on vAttributes. An error will occur if used on a gAttribute.

## <CONFIRM ,zVAR >

Confirms the current zVariable (in the current CDF). Required arguments are as follows:

out: INTEGER\*4 var\_num

zVariable number.

The only required preselected object/state is the current CDF.

## <CONFIRM ,zVAR CACHESIZE >

Confirms the number of cache buffers being used for the current zVariable's file (of the current CDF). This operation is not applicable to a single-file CDF. The Concepts chapter in the CDF User's Guide describes the caching scheme used by the CDF library. Required arguments are as follows:

out: INTEGER\*4 num buffers

The number of cache buffers being used.

The required preselected objects/states are the current CDF and its current zVariable.

# <CONFIRM ,zVAR DIMCOUNTS >

Confirms the current dimension counts for the current zVariable in the current CDF. For 0-dimensional zVariables this operation is not applicable. Required arguments are as follows:

out: INTEGER\*4 counts(CDF\_MAX\_DIMS)

Dimension counts. Each element of counts receives the corresponding dimension count.

The required preselected objects/states are the current CDF and its current zVariable.

#### <CONFIRM ,zVAR DIMINDICES >

Confirms the current dimension indices for the current zVariable in the current CDF. For 0-dimensional zVariables this operation is not applicable. Required arguments are as follows:

out: INTEGER\*4 indices(CDF MAX DIMS)

Dimension indices. Each element of indices receives the corresponding dimension index.

The required preselected objects/states are the current CDF and its current zVariable.

## <CONFIRM ,zVAR DIMINTERVALS >

Confirms the current dimension intervals for the current zVariable in the current CDF. For 0-dimensional zVariables this operation is not applicable. Required arguments are as follows:

out: INTEGER\*4 intervals(CDF MAX DIMS)

Dimension intervals. Each element of intervals receives the corresponding dimension interval.

The required preselected objects/states are the current CDF and its current zVariable.

# <CONFIRM\_,zVAR\_EXISTENCE\_>

Confirms the existence of the named zVariable (in the current CDF). If the zVariable does not exist, an error code will be returned. in any case the current zVariable is not affected. Required arguments are as follows:

in: CHARACTER var name\*(\*)

The zVariable name. This may be at most CDF VAR NAME LEN characters.

The only required preselected object/state is the current CDF.

### <CONFIRM ,zVAR PADVALUE >

Confirms the existence of an explicitly specified pad value for the current zVariable (in the current CDF). If An explicit pad value has not been specified, the informational status code NO\_PADVALUE\_SPECIFIED will be returned.

There are no required arguments.

The required preselected objects/states are the current CDF and its current zVariable.

## <CONFIRM\_,zVAR\_RECCOUNT\_>

Confirms the current record count for the current zVariable in the current CDF. Required arguments are as follows:

out: INTEGER\*4 rec\_count

Record count.

The required preselected objects/states are the current CDF and its current zVariable.

## <CONFIRM ,zVAR RECINTERVAL >

Confirms the current record interval for the current zVariable in the current CDF. Required arguments are as follows:

out: INTEGER\*4 rec interval

Record interval.

The required preselected objects/states are the current CDF and its current zVariable.

#### <CONFIRM ,zVAR RECNUMBER >

Confirms the current record number for the current zVariable in the current CDF. Required arguments are as follows:

out: INTEGER\*4 rec num

Record number.

The required preselected objects/states are the current CDF and its current zVariable.

## <CONFIRM ,zVAR RESERVEPERCENT >

Confirms the reserve percentage being used for the current zVariable (of the current CDF). This operation is only applicable to compressed zVariables. The Concepts chapter in the CDF User's Guide describes the reserve percentage scheme used by the CDF library. Required arguments are as follows:

out: INTEGER\*4 percent

The reserve percentage.

The required preselected objects/states are the current CDF and its current zVariable.

## <CONFIRM ,zVAR SEQPOS >

Confirms the current sequential value for sequential access for the current zVariable (in the current CDF). Note that a current sequential value is maintained for each zVariable individually. Required arguments are as follows:

out: INTEGER\*4 rec num

Record number.

out: INTEGER\*4 indices(CDF\_MAX\_DIMS)

Dimension indices. Each element of indices receives the corresponding dimension index. For 0-dimensional zVariables this argument is ignored (but must be present).

The required preselected objects/states are the current CDF and its current zVariable.

#### <CREATE ,ATTR >

A new attribute will be created in the current CDF. An attribute with the same name must not already exist in the CDF. The created attribute implicitly becomes the current attribute (in the current CDF). Required arguments are as follows:

in: CHARACTER attr\_name\*(\*)

Name of the attribute to be created. This can be at most CDF\_ATTR\_NAME\_LEN characters. Attribute names are case-sensitive.

in: INTEGER\*4 scope

Scope of the new attribute. Specify one of the scopes described in Section 4.12.

out: INTEGER\*4 attr num

Number assigned to the new attribute. This number must be used in subsequent CDF function calls when referring to this attribute. An existing attribute's number may also be determined with the <GET ,ATTR NUMBER > operation.

The only required preselected object/state is the current CDF.

# <CREATE\_,CDF\_>

A new CDF will be created. It is illegal to create a CDF that already exists. The created CDF implicitly becomes the current CDF. Required arguments are as follows:

in: CHARACTER CDF name\*(\*)

File name of the CDF to be created. (Do not append an extension.) This can be at most CDF\_PATHNAME\_LEN characters. A CDF file name may contain disk and directory specifications

that conform to the conventions of the operating system being used (including logical names on VMS systems and environment variables on UNIX systems).

UNIX: File names are case-sensitive.

#### in: INTEGER\*4 num dims

Number of dimensions for the rVariables. This can be as few as zero (0) and at most CDF MAX DIMS. Note that this must be specified even if the CDF will contain only zVariables.

## in: INTEGER\*4 dim\_sizes(\*)

Dimension sizes for the rVariables. Each element of dim\_sizes specifies the corresponding dimension size. Each dimension size must be greater than zero (0). For 0-dimensional rVariables this argument is ignored (but must be present). Note that this must be specified even if the CDF will contain only zVariables.

out: INTEGER\*4 id

CDF identifier to be used in subsequent operations on the CDF.

A CDF is created with the default format, encoding, and variable majority as specified in the configuration file of your CDF distribution. Consult your system manager to determine these defaults. These defaults can then be changed with the corresponding <PUT\_,CDF\_FORMAT\_>, <PUT\_,CDF\_ENCODING\_>, and <PUT\_,CDF\_MAJORITY\_> operations if necessary.

A CDF must be closed with the <CLOSE\_,CDF\_> operation to ensure that the CDF will be correctly written to disk.

There are no required preselected objects/states.

## <CREATE ,rVAR >

A new rVariable will be created in the current CDF. A variable (rVariable or zVariable) with the same name must not already exist in the CDF. The created rVariable implicitly becomes the current rVariable (in the current CDF). Required arguments are as follows:

#### in: CHARACTER var name\*(\*)

Name of the rVariable to be created. This can be at most CDF\_VAR\_NAME\_LEN characters (excluding the NUL). Variable names are case-sensitive.

# in: INTEGER\*4 data\_type

Data type of the new rVariable. Specify one of the data types described in Section 4.5.

# in: INTEGER\*4 num\_elements

Number of elements of the data type at each value. For character data types (CDF\_CHAR and CDF\_UCHAR), this is the number of characters in each string (an array of characters). A string exists at each value of the variable. For the non-character data types this must be one (1) - multiple elements are not allowed for non-character data types.

# in: INTEGER\*4 rec\_vary

Record variance. Specify one of the variances described in Section 4.9.

### in: INTEGER\*4 dim varys(\*)

Dimension variances. Each element of dim\_varys specifies the corresponding dimension variance. For each dimension specify one of the variances described in Section 4.9. For 0-dimensional rVariables this argument is ignored (but must be present).

out: INTEGER\*4 var num

Number assigned to the new rVariable. This number must be used in subsequent CDF function calls when referring to this rVariable. An existing rVariable's number may also be determined with the <GET ,rVAR NUMBER > operation.

The only required preselected object/state is the current CDF.

#### <CREATE ,zVAR >

A new zVariable will be created in the current CDF. A variable (rVariable or zVariable) with the same name must not already exist in the CDF. The created zVariable implicitly becomes the current zVariable (in the current CDF). Required arguments are as follows:

in: CHARACTER var\_name\*(\*)

Name of the zVariable to be created. This can be at most CDF\_VAR\_NAME\_LEN characters. Variable names are case-sensitive.

in: INTEGER\*4 data\_type

Data type of the new zVariable. Specify one of the data types described in Section 4.5.

in: INTEGER\*4 num\_elements

Number of elements of the data type at each value. For character data types (CDF\_CHAR and CDF\_UCHAR), this is the number of characters in each string (an array of characters). A string exists at each value of the variable. For the non-character data types this must be one (1) - multiple elements are not allowed for non-character data types.

in: INTEGER\*4 num dims

Number of dimensions for the zVariable. This may be as few as zero and at most CDF\_MAX\_DIMS.

in: INTEGER\*4 dim sizes(\*)

The dimension sizes. Each element of dim\_sizes specifies the corresponding dimension size. Each dimension size must be greater than zero (0). For a 0-dimensional zVariable this argument is ignored (but must be present).

in: INTEGER\*4 rec\_vary

Record variance. Specify one of the variances described in Section 4.9.

in: INTEGER\*4 dim varys(\*)

Dimension variances. Each element of dim\_varys specifies the corresponding dimension variance. For each dimension specify one of the variances described in Section 4.9. For a 0-dimensional zVariable this argument is ignored (but must be present).

out: INTEGER\*4 var\_num

Number assigned to the new zVariable. This number must be used in subsequent CDF function calls when referring to this zVariable. An existing zVariable's number may also be determined with the <GET ,zVAR NUMBER > operation.

The only required preselected object/state is the current CDF.

#### <DELETE ,ATTR >

Deletes the current attribute (in the current CDF). Note that the attribute's entries are also deleted. The attributes which numerically follow the attribute being deleted are immediately renumbered. When the attribute is deleted, there is no longer a current attribute.

There are no required arguments.

The required preselected objects/states are the current CDF and its current attribute.

#### <DELETE ,CDF >

Deletes the current CDF. A CDF must be opened before it can be deleted. When the CDF is deleted, there is no longer a current CDF.

There are no required arguments.

The only required preselected object/state is the current CDF.

#### <DELETE ,gENTRY >

Deletes the gEntry at the current gEntry number of the current attribute (in the current CDF). Note that this does not affect the current gEntry number.

There are no required arguments.

The required preselected objects/states are the current CDF, its current attribute, and its current gEntry number.

**NOTE:** Only use this operation on gAttributes. An error will occur if used on a vAttribute.

# <DELETE\_,rENTRY\_>

Deletes the rEntry at the current rEntry number of the current attribute (in the current CDF). Note that this does not affect the current rEntry number.

There are no required arguments.

The required preselected objects/states are the current CDF, its current attribute, and its current rEntry number.

NOTE: Only use this operation on vAttributes. An error will occur if used on a gAttribute.

# <DELETE ,rVAR >

Deletes the current rVariable (in the current CDF). Note that the rVariable's corresponding rEntries are also deleted (from each vAttribute). The rVariables which numerically follow the rVariable being deleted are immediately renumbered. The rEntries which numerically follow the rEntries being deleted are also immediately renumbered. When the rVariable is deleted, there is no longer a current rVariable. **NOTE:** This operation is only allowed on single-file CDFs.

There are no required arguments.

The required preselected objects/states are the current CDF and its current rVariable.

## <DELETE ,rVAR RECORDS >

Deletes the specified range of records from the current rVariable (in the current CDF). If the rVariable has sparse records a gap of missing records will be created. If the rVariable does not have sparse records, the records following the range of deleted records are immediately renumbered beginning with the number of the first deleted record. **NOTE:** This operation is only allowed on single-file CDFs.

Required arguments are as follows:

in: INTEGER\*4 first record

The record number of the first record to be deleted.

in: INTEGER\*4 last record

The record number of the last record to be deleted.

The required preselected objects/states are the current CDF and its current rVariable.

### <DELETE ,zENTRY >

Deletes the zEntry at the current zEntry number of the current attribute (in the current CDF). Note that this does not affect the current zEntry number.

There are no required arguments.

The required preselected objects/states are the current CDF, its current attribute, and its current zEntry number.

**NOTE:** Only use this operation on vAttributes. An error will occur if used on a gAttribute.

#### <DELETE ,zVAR >

Deletes the current zVariable (in the current CDF). Note that the zVariable's corresponding zEntries are also deleted (from each vAttribute). The zVariables which numerically follow the zVariable being deleted are immediately renumbered. The rEntries which numerically follow the rEntries being deleted are also immediately renumbered. When the zVariable is deleted, there is no longer a current zVariable. **NOTE:** This operation is only allowed on single-file CDFs.

There are no required arguments.

The required preselected objects/states are the current CDF and its current rVariable.

# <DELETE\_,zVAR\_RECORDS\_>

Deletes the specified range of records from the current zVariable (in the current CDF). If the zVariable has sparse records a gap of missing records will be created. If the zVariable does not have sparse records, the records following the range of deleted records are immediately renumbered beginning with the number of the first deleted record. **NOTE:** This operation is only allowed on single-file CDFs. Required arguments are as follows:

in: INTEGER\*4 first record

The record number of the first record to be deleted.

in: INTEGER\*4 last record

The record number of the last record to be deleted.

The required preselected objects/states are the current CDF and its current zVariable.

<GET\_,ATTR\_MAXgENTRY\_>

Inquires the maximum gEntry number used for the current attribute (in the current CDF). This does not necessarily correspond with the number of gEntries for the attribute. Required arguments are as follows:

out: INTEGER\*4 max\_entry

The maximum gEntry number for the attribute. If no gEntries exist, then a value of -1 will be passed back.

The required preselected objects/states are the current CDF and its current attribute.

**NOTE:** Only use this operation on gAttributes. An error will occur if used on a vAttribute.

#### <GET ,ATTR MAXrENTRY >

Inquires the maximum rEntry number used for the current attribute (in the current CDF). This does not necessarily correspond with the number of rEntries for the attribute. Required arguments are as follows:

out: INTEGER\*4 max entry

The maximum rEntry number for the attribute. If no rEntries exist, then a value of -1 will be passed back.

The required preselected objects/states are the current CDF and its current attribute.

**NOTE:** Only use this operation on vAttributes. An error will occur if used on a gAttribute.

#### <GET ,ATTR MAXzENTRY >

Inquires the maximum zEntry number used for the current attribute (in the current CDF). This does not necessarily correspond with the number of zEntries for the attribute. Required arguments are as follows:

out: INTEGER\*4 max entry

The maximum zEntry number for the attribute. If no zEntries exist, then a value of -1 will be passed back.

The required preselected objects/states are the current CDF and its current attribute.

**NOTE:** Only use this operation on vAttributes. An error will occur if used on a gAttribute.

# <GET\_,ATTR\_NAME\_>

Inquires the name of the current attribute (in the current CDF). Required arguments are as follows:

out: CHARACTER attr\_name\*(CDF\_ATTR\_NAME\_LEN)

Attribute name. This character string will be blank padded if necessary.

**UNIX:** For the proper operation of CDF\_lib, attr\_name MUST be a Fortran CHARACTER variable or constant.

The required preselected objects/states are the current CDF and its current attribute.

#### <GET ,ATTR NUMBER >

Gets the number of the named attribute (in the current CDF). Note that this operation does not select the current attribute. Required arguments are as follows:

in: CHARACTER attr name\*(\*)

Attribute name. This may be at most CDF ATTR NAME LEN characters.

**UNIX:** For the proper operation of CDF\_lib, attr\_name MUST be a Fortran CHARACTER variable or constant.

out: INTEGER\*4 attr\_num

The attribute number.

The only required preselected object/state is the current CDF.

## <GET ,ATTR NUMgENTRIES >

Inquires the number of gEntries for the current attribute (in the current CDF). This does not necessarily correspond with the maximum gEntry number used. Required arguments are as follows:

out: INTEGER\*4 num entries

The number of gEntries for the attribute.

The required preselected objects/states are the current CDF and its current attribute.

NOTE: Only use this operation on gAttributes. An error will occur if used on a vAttribute.

#### <GET ,ATTR NUMrENTRIES >

Inquires the number of rEntries for the current attribute (in the current CDF). This does not necessarily correspond with the maximum rEntry number used. Required arguments are as follows:

out: INTEGER\*4 num entries

The number of rEntries for the attribute.

The required preselected objects/states are the current CDF and its current attribute.

**NOTE:** Only use this operation on vAttributes. An error will occur if used on a gAttribute.

#### <GET ,ATTR NUMZENTRIES >

Inquires the number of zEntries for the current attribute (in the current CDF). This does not necessarily correspond with the maximum zEntry number used. Required arguments are as follows:

out: INTEGER\*4 num entries

The number of zEntries for the attribute.

The required preselected objects/states are the current CDF and its current attribute.

NOTE: Only use this operation on vAttributes. An error will occur if used on a gAttribute.

## <GET ,ATTR SCOPE >

Inquires the scope of the current attribute (in the current CDF). Required arguments are as follows:

out: INTEGER\*4 scope

Attribute scope. The scopes are described in Section 4.12.

The required preselected objects/states are the current CDF and its current attribute.

## <GET ,CDF COMPRESSION >

Inquires the compression type/parameters of the current CDF. This refers to the compression of the CDF - not of any compressed variables. Required arguments are as follows:

out: INTEGER\*4 c\_type

The compression type. The types of compressions are described in Section 4.10.

out: INTEGER\*4 c\_parms(CDF\_MAX\_PARMS)

The compression parameters. The compression parameters are described in Section 4.10.

out: INTEGER\*4 c pct

If compressed, the percentage of the uncompressed size of the CDF needed to store the compressed CDF.

The only required preselected object/state is the current CDF.

## <GET ,CDF COPYRIGHT >

Reads the copyright notice for the CDF library that created the current CDF. Required arguments are as follows:

out: CHARACTER copy right\*(CDF COPYRIGHT LEN)

CDF copyright text. The character string will be padded if necessary.

**UNIX:** For the proper operation of CDF\_lib, copy\_right MUST be a Fortran CHARACTER variable or constant.

The only required preselected object/state is the current CDF.

## <GET ,CDF ENCODING >

Inquires the data encoding of the current CDF. Required arguments are as follows:

out: INTEGER\*4 encoding

Data encoding. The encodings are described in Section 4.6.

The only required preselected object/state is the current CDF.

## <GET ,CDF FORMAT >

Inquires the format of the current CDF. Required arguments are as follows:

out: INTEGER\*4 format

CDF format. The formats are described in Section 4.4.

The only required preselected object/state is the current CDF.

#### <GET ,CDF INCREMENT >

Inquires the incremental number of the CDF library that created the current CDF. Required arguments are as follows:

out: INTEGER\*4 increment

Incremental number.

The only required preselected object/state is the current CDF.

# <GET\_,CDF\_INFO\_>

Inquires the compression type/parameters of a CDF without having to open the CDF. This refers to the compression of the CDF - not of any compressed variables. Required arguments are as follows:

in: CHARACTER CDF name\*(\*)

File name of the CDF to be inquired. (Do not append an extension.) This can be at most CDF\_PATHNAME\_LEN characters. A CDF file name may contain disk and directory specifications that conform to the conventions of the operating system being used (including logical names on VMS systems and environment variables on UNIX systems).

**UNIX**: File names are case-sensitive.

UNIX: For the proper operation of CDF\_lib, CDF\_name MUST be a Fortran CHARACTER variable or constant.

out: INTEGER\*4 c\_type

The CDF compression type. The types of compressions are described in Section 4.10.

out: INTEGER\*4 c\_parms(CDF\_MAX\_PARMS)

The compression parameters. The compression parameters are described in Section 4.10.

out: INTEGER\*8<sup>10</sup> c size

If compressed, size in bytes of the dotCDF file. If not compressed, set to zero (0).

out: INTEGER\*8<sup>10</sup> u size

If compressed, size in bytes of the dotCDF file when decompressed. If not compressed, size in bytes of the dotCDF file.

There are no required preselected objects/states.

#### <GET ,CDF MAJORITY >

Inquires the variable majority of the current CDF. Required arguments are as follows:

out: INTEGER\*4 majority

Variable majority. The majorities are described in Section 4.8.

The only required preselected object/state is the current CDF.

# <GET ,CDF NUMATTRS >

Inquires the number of attributes in the current CDF. Required arguments are as follows:

out: INTEGER\*4 num attrs

Number of attributes.

<sup>&</sup>lt;sup>10</sup> You need to have a Fortran compiler supporting 8-byte integer.

The only required preselected object/state is the current CDF.

# <GET ,CDF NUMgATTRS >

Inquires the number of gAttributes in the current CDF. Required arguments are as follows:

out: INTEGER\*4 num attrs

Number of gAttributes.

The only required preselected object/state is the current CDF.

#### <GET ,CDF NUMrVARS >

Inquires the number of rVariables in the current CDF. Required arguments are as follows:

out: INTEGER\*4 num\_vars

Number of rVariables.

The only required preselected object/state is the current CDF.

# <GET ,CDF NUMvATTRS >

Inquires the number of vAttributes in the current CDF. Required arguments are as follows:

out: INTEGER\*4 num\_attrs

Number of vAttributes.

The only required preselected object/state is the current CDF.

# <GET\_,CDF\_NUMzVARS\_>

Inquires the number of zVariables in the current CDF. Required arguments are as follows:

out: INTEGER\*4 num\_vars

Number of zVariables.

The only required preselected object/state is the current CDF.

## <GET ,CDF RELEASE >

Inquires the release number of the CDF library that created the current CDF. Required arguments are as follows:

out: INTEGER\*4 release

Release number.

The only required preselected object/state is the current CDF.

#### <GET ,CDF VERSION >

Inquires the version number of the CDF library that created the current CDF. Required arguments are as follows:

out: INTEGER\*4 version

Version number.

The only required preselected object/state is the current CDF.

### <GET ,DATATYPE SIZE >

Inquires the size (in bytes) of an element of the specified data type. Required arguments are as follows:

in: INTEGER\*4 data type

Data type.

out: INTEGER\*4 num\_bytes

Number of bytes per element.

There are no required preselected objects/states.

# <GET\_,gENTRY\_DATA >

Reads the gEntry data value from the current attribute at the current gEntry number (in the current CDF). Required arguments are as follows:

out: <type> value

Value. This buffer must be large to hold the value. (<type> is dependent on the data type of the gEnrty). The value is read from the CDF and placed into memory at address value.

**WARNING:** If the gEntry has one of the character data types (CDF\_CHAR or CDF\_UCHAR), then value must be a CHARACTER Fortran variable. If the gEntry does not have one of the character data types, then value must NOT be a CHARACTER Fortran variable.

The required preselected objects/states are the current CDF, its current attribute, and its current gEntry number.

NOTE: Only use this operation on gAttributes. An error will occur if used on a vAttribute.

# <GET ,gENTRY DATATYPE >

Inquires the data type of the gEntry at the current gEntry number for the current attribute (in the current CDF). Required arguments are as follows:

out: INTEGER\*4 data\_type

Data type. The data types are described in Section 4.5.

The required preselected objects/states are the current CDF, its current attribute, and its current gEntry number.

**NOTE:** Only use this operation on gAttributes. An error will occur if used on a vAttribute.

# <GET\_,gENTRY\_NUMELEMS\_>

Inquires the number of elements (of the data type) of the gEntry at the current gEntry number for the current attribute (in the current CDF). Required arguments are as follows:

out: INTEGER\*4 num elements

Number of elements of the data type. For character data types (CDF\_CHAR and CDF\_UCHAR) this is the number of characters in the string (an array of characters). For all other data types this is the number of elements in an array of that data type.

The required preselected objects/states are the current CDF, its current attribute, and its current gEntry number.

**NOTE:** Only use this operation on gAttributes. An error will occur if used on a vAttribute.

## <GET ,LIB COPYRIGHT >

Reads the copyright notice of the CDF library being used. Required arguments are as follows:

out: CHARACTER copy right\*(CDF COPYRIGHT LEN)

CDF library copyright text.

**UNIX:** For the proper operation of CDF\_lib, copy\_right MUST be a Fortran CHARACTER variable or constant.

There are no required preselected objects/states.

## <GET\_,LIB\_INCREMENT\_>

Inquires the incremental number of the CDF library being used. Required arguments are as follows:

out: INTEGER\*4 increment

Incremental number.

There are no required preselected objects/states.

## <GET ,LIB RELEASE >

Inquires the release number of the CDF library being used. Required arguments are as follows:

out: INTEGER\*4 release

Release number.

There are no required preselected objects/states.

# <GET\_,LIB\_subINCREMENT\_>

Inquires the subincremental character of the CDF library being used. Required arguments are as follows:

out: CHARACTER\*1 \*subincrement

Subincremental character.

**UNIX:** For the proper operation of CDF\_lib, subincrement MUST be a Fortran CHARACTER variable or constant.

There are no required preselected objects/states.

# <GET\_,LIB\_VERSION\_>

Inquires the version number of the CDF library being used. Required arguments are as follows:

out: INTEGER\*4 version

Version number.

There are no required preselected objects/states.

<GET ,rENTRY DATA >

Reads the rEntry data value from the current attribute at the current rEntry number (in the current CDF). Required arguments are as follows:

out: <type> value

Value. This buffer must be large to hold the value. <type> is dependent on the data type of the rEnrty. The value is read from the CDF and placed into memory at address value.

**WARNING:** If the rEntry has one of the character data types (CDF\_CHAR or CDF\_UCHAR), then value must be a CHARACTER Fortran variable. If the rEntry does not have one of the character data types, then value must NOT be a CHARACTER Fortran variable.

The required preselected objects/states are the current CDF, its current attribute, and its current rEntry number.

**NOTE:** Only use this operation on vAttributes. An error will occur if used on a gAttribute.

## <GET ,rENTRY DATATYPE >

Inquires the data type of the rEntry at the current rEntry number for the current attribute (in the current CDF). Required arguments are as follows:

out: INTEGER\*4 data\_type

Data type. The data types are described in Section 4.5.

The required preselected objects/states are the current CDF, its current attribute, and its current rEntry number.

**NOTE:** Only use this operation on vAttributes. An error will occur if used on a gAttribute.

#### <GET ,rENTRY NUMELEMS >

Inquires the number of elements (of the data type) of the rEntry at the current rEntry number for the current attribute (in the current CDF). Required arguments are as follows:

out: INTEGER\*4 num\_elements

Number of elements of the data type. For character data types (CDF\_CHAR and CDF\_UCHAR) this is the number of characters in the string (an array of characters). For all other data types this is the number of elements in an array of that data type.

The required preselected objects/states are the current CDF, its current attribute, and its current rEntry number.

**NOTE:** Only use this operation on vAttributes. An error will occur if used on a gAttribute.

#### <GET ,rVAR ALLOCATEDFROM >

Inquires the next allocated record at or after a given record for the current rVariable (in the current CDF). Required arguments are as follows:

in: INTEGER\*4 start record

The record number at which to begin searching for the next allocated record. If this record exists, it will be considered the next allocated record.

out: INTEGER\*4 next\_record

The number of the next allocated record.

The required preselected objects/states are the current CDF and its current rVariable.

#### <GET ,rVAR ALLOCATEDTO >

Inquires the last allocated record (before the next unallocated record) at or after a given record for the current rVariable (in the current CDF). Required arguments are as follows:

in: INTEGER\*4 start record

The record number at which to begin searching for the last allocated record.

out: INTEGER\*4 next record

The number of the last allocated record.

The required preselected objects/states are the current CDF and its current rVariable.

# <GET ,rVAR BLOCKINGFACTOR >11

Inquires the blocking factor for the current rVariable (in the current CDF). Blocking factors are described in the Concepts chapter in the CDF User's Guide. Required arguments are as follows:

out: INTEGER\*4 blocking\_factor

The blocking factor. A value of zero (0) indicates that the default blocking factor is being used.

The required preselected objects/states are the current CDF and its current rVariable.

# <GET ,rVAR COMPRESSION >

Inquires the compression type/parameters of the current rVariable (in the current CDF). Required arguments are as follows:

out: INTEGER\*4 c type

The compression type. The types of compressions are described in Section 4.10.

out: INTEGER\*4 c parms(CDF MAX PARMS)

The compression parameters. The compression parameters are described in Section 4.10.

out: INTEGER\*4 c\_pct

If compressed, the percentage of the uncompressed size of the rVariable's data values needed to store the compressed values.

The required preselected objects/states are the current CDF and its current rVariable.

# <GET\_,rVAR\_DATA\_>

Reads a value from the current rVariable (in the current CDF). The value is read at the current record number and current dimension indices for the rVariables (in the current CDF). Required arguments are as follows:

out: <type> value

Value. This buffer must be large to hold the value. <type> is dependent on the data type of the rVariable. The value is read from the CDF and placed into memory at address value.

<sup>&</sup>lt;sup>11</sup> The item rVAR\_BLOCKINGFACTOR was previously named rVAR\_EXTENDRECS.

**WARNING:** If the rVariable has one of the character data types (CDF\_CHAR or CDF\_UCHAR), then value must be a CHARACTER Fortran variable. If the rVariable does not have one of the character data types, then value must NOT be a CHARACTER Fortran variable.

The required preselected objects/states are the current CDF, its current rVariable, its current record number for rVariables, and its current dimension indices for rVariables.

#### <GET ,rVAR DATATYPE >

Inquires the data type of the current rVariable (in the current CDF). Required arguments are as follows:

out: INTEGER\*4 data\_type

Data type. The data types are described in Section 4.5.

The required preselected objects/states are the current CDF and its current rVariable.

# <GET ,rVAR DIMVARYS >

Inquires the dimension variances of the current rVariable (in the current CDF). For 0-dimensional rVariables this operation is not applicable. Required arguments are as follows:

out: INTEGER\*4 dim varys(CDF MAX DIMS)

Dimension variances. Each element of dim\_varys receives the corresponding dimension variance. The variances are described in Section 4.9.

The required preselected objects/states are the current CDF and its current rVariable.

#### <GET ,rVAR HYPERDATA >

Reads one or more values from the current rVariable (in the current CDF). The values are read based on the current record number, current record count, current record interval, current dimension indices, current dimension counts, and current dimension intervals for the rVariables (in the current CDF). Required arguments are as follows:

out: <type> buffer

Value. This buffer must be large to hold the value. <type> is dependent on the data type of the rVariable. The value is read from the CDF and placed into memory at address value.

**WARNING:** If the rVariable has one of the character data types (CDF\_CHAR or CDF\_UCHAR), then value must be a CHARACTER Fortran variable. If the rVariable does not have one of the character data types, then value must NOT be a CHARACTER Fortran variable.

The required preselected objects/states are the current CDF, its current rVariable, its current record number, record count, and record interval for rVariables, and its current dimension indices, dimension counts, and dimension intervals for rVariables.

#### <GET ,rVAR MAXallocREC >

Inquires the maximum record number allocated for the current rVariable (in the current CDF). Required arguments are as follows:

out: INTEGER\*4 max rec

Maximum record number allocated.

The required preselected objects/states are the current CDF and its current rVariable.

## <GET ,rVAR MAXREC >

Inquires the maximum record number for the current rVariable (in the current CDF). For rVariables with a record variance of NOVARY, this will be at most zero (0). A value of negative one (-1) indicates that no records have been written. Required arguments are as follows:

out: INTEGER\*4 max rec

Maximum record number.

The required preselected objects/states are the current CDF and its current rVariable.

#### <GET ,rVAR NAME >

Inquires the name of the current rVariable (in the current CDF). Required arguments are as follows:

out: CHARACTER var name\*(CDF VAR NAME LEN

Name of the rVariable. This character string will be padded if necessary.

**UNIX:** For the proper operation of CDF\_lib, var\_name MUST be a Fortran CHARACTER variable or constant.

The required preselected objects/states are the current CDF and its current rVariable.

#### <GET ,rVAR nINDEXENTRIES >

Inquires the number of index entries for the current rVariable (in the current CDF). This only has significance for rVariables that are in single-file CDFs. The Concepts chapter in the CDF User's Guide describes the indexing scheme used for variable records in a single-file CDF. Required arguments are as follows:

out: INTEGER\*4 num\_entries

Number of index entries.

The required preselected objects/states are the current CDF and its current rVariable.

#### <GET ,rVAR nINDEXLEVELS >

Inquires the number of index levels for the current rVariable (in the current CDF). This only has significance for rVariables that are in single-file CDFs. The Concepts chapter in the CDF User's Guide describes the indexing scheme used for variable records in a single-file CDF. Required arguments are as follows:

out: INTEGER\*4 num levels

Number of index levels.

The required preselected objects/states are the current CDF and its current rVariable.

# <GET\_,rVAR\_nINDEXRECORDS\_>

Inquires the number of index records for the current rVariable (in the current CDF). This only has significance for rVariables that are in single-file CDFs. The Concepts chapter in the CDF User's Guide describes the indexing scheme used for variable records in a single-file CDF. Required arguments are as follows:

out: INTEGER\*4 num records

Number of index records.

The required preselected objects/states are the current CDF and its current rVariable.

## <GET ,rVAR NUMallocRECS >

Inquires the number of records allocated for the current rVariable (in the current CDF). The Concepts chapter in the CDF User's Guide describes the allocation of variable records in a single-file CDF. Required arguments are as follows:

out: INTEGER\*4 num\_records

Number of allocated records.

The required preselected objects/states are the current CDF and its current rVariable.

#### <GET ,rVAR NUMBER >

Gets the number of the named rVariable (in the current CDF). Note that this operation does not select the current rVariable. Required arguments are as follows:

in: CHARACTER var name\*(\*)

The rVariable name. This may be at most CDF\_VAR\_NAME\_LEN characters.

UNIX: For the proper operation of CDF\_lib, var\_name MUST be a Fortran CHARACTER variable or constant.

out: INTEGER\*4 var num

The rVariable number.

The only required preselected object/state is the current CDF.

#### <GET ,rVAR NUMELEMS >

Inquires the number of elements (of the data type) for the current rVariable (in the current CDF). Required arguments are as follows:

out: INTEGER\*4 num\_elements

Number of elements of the data type at each value. For character data types (CDF\_CHAR and CDF\_UCHAR) this is the number of characters in the string. (Each value consists of the entire string.) For all other data types this will always be one (1) – multiple elements at each value are not allowed for non-character data types.

The required preselected objects/states are the current CDF and its current rVariable.

## <GET ,rVAR NUMRECS >

Inquires the number of records written for the current rVariable (in the current CDF). This may not correspond to the maximum record written (see <GET\_,rVAR\_MAXREC\_>) if the rVariable has sparse records. Required arguments are as follows:

out: INTEGER\*4 num records

Number of records written.

The required preselected objects/states are the current CDF and its current rVariable.

## <GET ,rVAR PADVALUE >

Inquires the pad value of the current rVariable (in the current CDF). If a pad value has not been explicitly specified for the rVariable (see <PUT ,rVAR PADVALUE >), the informational status code

NO\_PADVALUE\_SPECIFIED will be returned and the default pad value for the rVariable's data type will be placed in the pad value buffer provided. Required arguments are as follows:

```
out: <type> value
```

Pad value. This buffer must be large to hold the value. <type> is dependent on the data type of the pad value. The value is read from the CDF and placed into memory at address value.

**WARNING:** If the rVariable has one of the character data types (CDF\_CHAR or CDF\_UCHAR), then value must be a CHARACTER Fortran variable. If the rVariable does not have one of the character data types, then value must NOT be a CHARACTER Fortran variable.

The required preselected objects/states are the current CDF and its current rVariable.

#### <GET ,rVAR RECVARY >

Inquires the record variance of the current rVariable (in the current CDF). Required arguments are as follows:

```
out: INTEGER*4 rec vary
```

Record variance. The variances are described in Section 4.9.

The required preselected objects/states are the current CDF and its current rVariable.

#### <GET ,rVAR SEQDATA >

Reads one value from the current rVariable (in the current CDF) at the current sequential value for that rVariable. After the read the current sequential value is automatically incremented to the next value (crossing a record boundary If necessary). An error is returned if the current sequential value is past the last record for the rVariable. Required arguments are as follows:

```
out: <type> value
```

Value. This buffer must be large to hold the value. <type> is dependent on the data type of the rVariable. The value is read from the CDF and placed into memory at address value.

**WARNING:** If the rVariable has one of the character data types (CDF\_CHAR or CDF\_UCHAR), then value must be a CHARACTER Fortran variable. If the rVariable does not have one of the character data types, then value must NOT be a CHARACTER Fortran variable.

The required preselected objects/states are the current CDF, its current rVariable, and the current sequential value for the rVariable. Note that the current sequential value for an rVariable increments automatically as values are read.

## <GET ,rVAR SPARSEARRAYS >

Inquires the sparse arrays type/parameters of the current rVariable (in the current CDF). Required arguments are as follows:

```
out: INTEGER*4 s arrays type
```

The sparse arrays type. The types of sparse arrays are described in Section 4.11.

```
out: INTEGER*4 a arrays parms(CDF MAX PARMS)
```

The sparse arrays parameters. The sparse arrays parameters are described in Section 4.11.

```
out: INTEGER*4 a arrays pct
```

If sparse arrays, the percentage of the non-sparse size of the rVariable's data values needed to store the sparse values.

The required preselected objects/states are the current CDF and its current rVariable.

## <GET ,rVAR SPARSERECORDS >

Inquires the sparse records type of the current rVariable (in the current CDF). Required arguments are as follows:

```
out: INTEGER*4 s_records_type
```

The sparse records type. The types of sparse records are described in Section 4.11.

The required preselected objects/states are the current CDF and its current rVariable.

## <GET\_,rVARs\_DIMSIZES\_>

Inquires the size of each dimension for the rVariables in the current CDF. For 0-dimensional rVariables this operation is not applicable. Required arguments are as follows:

```
out: INTEGER*4 dim_sizes(CDF_MAX_DIMS)
```

Dimension sizes. Each element of dim sizes receives the corresponding dimension size.

The only required preselected object/state is the current CDF.

#### <GET ,rVARs MAXREC >

Inquires the maximum record number of the rVariables in the current CDF. Note that this is not the number of records but rather the maximum record number (which is one less than the number of records). A value of negative one (-1) indicates that the rVariables contain no records. The maximum record number for an individual rVariable may be inquired using the <GET\_,rVAR\_MAXREC\_> operation. Required arguments are as follows:

```
out: INTEGER*4 max_rec
```

Maximum record number.

The only required preselected object/state is the current CDF.

#### <GET ,rVARs NUMDIMS >

Inquires the number of dimensions for the rVariables in the current CDF. Required arguments are as follows:

```
out: INTEGER*4 num_dims
```

Number of dimensions.

The only required preselected object/state is the current CDF.

## <GET ,rVARs RECDATA >

Reads full-physical records from one or more rVariables (in the current CDF). The full-physical records are read at the current record number for rVariables. This operation does not affect the current rVariable (in the current CDF). Required arguments are as follows:

```
in: INTEGER*4 num_vars
```

The number of rVariables from which to read. This must be at least one (1).

## in: INTEGER\*4 var nums(\*)

The rVariables from which to read. This array, whose size is determined by the value of num\_vars, contains rVariable numbers. The rVariable numbers can be listed in any order.

## in: <type> buffer

The buffer into which the full-physical rVariable records being read are to be placed. This buffer must be large enough to hold the full-physical records. <type> must be a Fortran variable that will be passed by reference and cannot be of type CHARACTER. (The CDF library is expecting an address at which to place the full-physical records being read.) The order of the full-physical rVariable records in this buffer will correspond to the rVariable numbers listed in varNums, and this buffer will be contiguous --- there will be no spacing between full-physical rVariable records. Be careful if using Fortran STRUCTUREs to receive multiple full-physical rVariable records. Fortran compilers on some operating systems will pad between the elements of a STRUCTURE in order to prevent memory alignment errors (i.e., the elements of a STRUCTURE may not be contiguous). See the Concepts chapter in the CDF User's Guide for more details on how to create this buffer.

The required preselected objects/states are the current CDF and its current record number for rVariables. 12

## <GET ,STATUS TEXT >

Inquires the explanation text for the current status code. Note that the current status code is NOT the status from the last operation performed. Required arguments are as follows:

```
out: CHARACTER text*(CDF_STATUSTEXT_LEN)
```

Text explaining the status code.

**UNIX:** For the proper operation of CDF\_lib, text MUST be a Fortran CHARACTER variable or constant.

The only required preselected object/state is the current status code.

# <GET ,zENTRY DATA >

Reads the zEntry data value from the current attribute at the current zEntry number (in the current CDF). Required arguments are as follows:

```
out: <type> value
```

Value. This buffer must be large to hold the value. <type> is dependent on the data type of the zEnrty. The value is read from the CDF and placed into memory at address value.

**WARNING:** If the zEntry has one of the character data types (CDF\_CHAR or CDF\_UCHAR), then value must be a CHARACTER Fortran variable. If the zEntry does not have one of the character data types, then value must NOT be a CHARACTER Fortran variable.

The required preselected objects/states are the current CDF, its current attribute, and its current zEntry number.

**NOTE:** Only use this operation on vAttributes. An error will occur if used on a gAttribute.

#### <GET ,zENTRY DATATYPE >

Inquires the data type of the zEntry at the current zEntry number for the current attribute (in the current CDF). Required arguments are as follows:

<sup>&</sup>lt;sup>12</sup> A Standard Interface at Section 5.24 provides the same functionality.

out: INTEGER\*4 data\_type

Data type. The data types are described in Section 4.5.

The required preselected objects/states are the current CDF, its current attribute, and its current zEntry number.

NOTE: Only use this operation on vAttributes. An error will occur if used on a gAttribute.

# <GET\_,zENTRY\_NUMELEMS >

Inquires the number of elements (of the data type) of the zEntry at the current zEntry number for the current attribute (in the current CDF). Required arguments are as follows:

out: INTEGER\*4 num elements

Number of elements of the data type. For character data types (CDF\_CHAR and CDF\_UCHAR) this is the number of characters in the string (an array of characters). For all other data types this is the number of elements in an array of that data type.

The required preselected objects/states are the current CDF, its current attribute, and its current zEntry number.

NOTE: Only use this operation on vAttributes. An error will occur if used on a gAttribute.

## <GET ,zVAR ALLOCATEDFROM >

Inquires the next allocated record at or after a given record for the current zVariable (in the current CDF). Required arguments are as follows:

in: INTEGER\*4 start record

The record number at which to begin searching for the next allocated record. If this record exists, it will be considered the next allocated record.

out: INTEGER\*4 next\_record

The number of the next allocated record.

The required preselected objects/states are the current CDF and its current zVariable.

## <GET\_,zVAR\_ALLOCATEDTO\_>

Inquires the last allocated record (before the next unallocated record) at or after a given record for the current zVariable (in the current CDF). Required arguments are as follows:

in: INTEGER\*4 start\_record

The record number at which to begin searching for the last allocated record.

out: INTEGER\*4 next\_record

The number of the last allocated record.

The required preselected objects/states are the current CDF and its current zVariable.

## <GET ,zVAR BLOCKINGFACTOR >13

Inquires the blocking factor for the current zVariable (in the current CDF). Blocking factors are described in the Concepts chapter in the CDF User's Guide. Required arguments are as follows:

 $<sup>^{\</sup>rm 13}$  The item <code>zVAR\_BLOCKINGFACTOR</code> was previously named <code>zVAR\_EXTENDRECS</code> .

out: INTEGER\*4 blocking factor

The blocking factor. A value of zero (0) indicates that the default blocking factor is being used.

The required preselected objects/states are the current CDF and its current zVariable.

## <GET ,zVAR COMPRESSION >

Inquires the compression type/parameters of the current zVariable (in the current CDF). Required arguments are as follows:

out: INTEGER\*4 c type

The compression type. The types of compressions are described in Section 4.10.

out: INTEGER\*4 c\_parms(CDF\_MAX\_PARMS)

The compression parameters. The compression parameters are described in Section 4.10.

out: INTEGER\*4 c\_pct

If compressed, the percentage of the uncompressed size of the zVariable's data values needed to store the compressed values.

The required preselected objects/states are the current CDF and its current zVariable.

#### <GET ,zVAR DATA >

Reads a value from the current zVariable (in the current CDF). The value is read at the current record number and current dimension indices for that zVariable (in the current CDF). Required arguments are as follows:

out: <type> value

Value. This buffer must be large to hold the value. <type> is dependent on the data type of the zVariable. The value is read from the CDF and placed into memory at address value.

**WARNING:** If the zVariable has one of the character data types (CDF\_CHAR or CDF\_UCHAR), then value must be a CHARACTER Fortran variable. If the zVariable does not have one of the character data types, then value must NOT be a CHARACTER Fortran variable.

The required preselected objects/states are the current CDF, its current zVariable, the current record number for the zVariable, and the current dimension indices for the zVariable.

#### <GET ,zVAR DATATYPE >

Inquires the data type of the current zVariable (in the current CDF). Required arguments are as follows:

out: INTEGER\*4 data type

Data type. The data types are described in Section 4.5.

The required preselected objects/states are the current CDF and its current zVariable.

## <GET ,zVAR DIMSIZES >

Inquires the size of each dimension for the current zVariable in the current CDF. For 0-dimensional zVariables this operation is not applicable. Required arguments are as follows:

out: INTEGER\*4 dim sizes(CDF MAX DIMS)

Dimension sizes. Each element of dim sizes receives the corresponding dimension size.

The required preselected objects/states are the current CDF and its current zVariable.

## <GET ,zVAR DIMVARYS >

Inquires the dimension variances of the current zVariable (in the current CDF). For 0-dimensional zVariables this operation is not applicable. Required arguments are as follows:

out: INTEGER\*4 dim varys(CDF MAX DIMS)

Dimension variances. Each element of dim\_varys receives the corresponding dimension variance. The variances are described in Section 4.9.

The required preselected objects/states are the current CDF and its current zVariable.

## <GET ,zVAR HYPERDATA >

Reads one or more values from the current zVariable (in the current CDF). The values are read based on the current record number, current record count, current record interval, current dimension indices, current dimension counts, and current dimension intervals for that zVariable (in the current CDF). Required arguments are as follows:

out: <type> buffer

Value. This buffer must be large to hold the value. <type> is dependent on the data type of the zVariable. The value is read from the CDF and placed into memory at address value.

**WARNING:** If the zVariable has one of the character data types (CDF\_CHAR or CDF\_UCHAR), then value must be a CHARACTER Fortran variable. If the zVariable does not have one of the character data types, then value must NOT be a CHARACTER Fortran variable.

The required preselected objects/states are the current CDF, its current zVariable, the current record number, record count, and record interval for the zVariable, and the current dimension indices, dimension counts, and dimension intervals for the zVariable.

#### <GET ,zVAR MAXallocREC >

Inquires the maximum record number allocated for the current zVariable (in the current CDF). Required arguments are as follows:

out: INTEGER\*4 max rec

Maximum record number allocated.

The required preselected objects/states are the current CDF and its current zVariable.

#### <GET ,zVAR MAXREC >

Inquires the maximum record number for the current zVariable (in the current CDF). For zVariables with a record variance of NOVARY, this will be at most zero (0). A value of negative one (-1) indicates that no records have been written. Required arguments are as follows:

out: INTEGER\*4 max\_rec

Maximum record number.

The required preselected objects/states are the current CDF and its current zVariable.

#### <GET ,zVAR NAME >

Inquires the name of the current zVariable (in the current CDF). Required arguments are as follows:

out: CHARACTER var name\*(CDF VAR NAME LEN)

Name of the zVariable.

**UNIX:** For the proper operation of CDF\_lib, var\_name MUST be a Fortran CHARACTER variable or constant.

The required preselected objects/states are the current CDF and its current zVariable.

## <GET ,zVAR nINDEXENTRIES >

Inquires the number of index entries for the current zVariable (in the current CDF). This only has significance for zVariables that are in single-file CDFs. The Concepts chapter in the CDF User's Guide describes the indexing scheme used for variable records in a single-file CDF. Required arguments are as follows:

out: INTEGER\*4 num entries

Number of index entries.

The required preselected objects/states are the current CDF and its current zVariable.

## <GET ,zVAR nINDEXLEVELS >

Inquires the number of index levels for the current zVariable (in the current CDF). This only has significance for zVariables that are in single-file CDFs. The Concepts chapter in the CDF User's Guide describes the indexing scheme used for variable records in a single-file CDF. Required arguments are as follows:

out: INTEGER\*4 num levels

Number of index levels.

The required preselected objects/states are the current CDF and its current zVariable.

#### <GET .zVAR nINDEXRECORDS >

Inquires the number of index records for the current zVariable (in the current CDF). This only has significance for zVariables that are in single-file CDFs. The Concepts chapter in the CDF User's Guide describes the indexing scheme used for variable records in a single-file CDF. Required arguments are as follows:

out: INTEGER\*4 num records

Number of index records.

The required preselected objects/states are the current CDF and its current zVariable.

#### <GET ,zVAR NUMallocRECS >

Inquires the number of records allocated for the current zVariable (in the current CDF). The Concepts chapter in the CDF User's Guide describes the allocation of variable records in a single-file CDF. Required arguments are as follows:

out: INTEGER\*4 num\_records

Number of allocated records.

The required preselected objects/states are the current CDF and its current zVariable.

#### <GET ,zVAR NUMBER >

Gets the number of the named zVariable (in the current CDF). Note that this operation does not select the current zVariable. Required arguments are as follows:

in: CHARACTER var name\*(\*)

The zVariable name. This may be at most CDF\_VAR\_NAME\_LEN characters.

**UNIX:** For the proper operation of CDF\_lib, var\_name MUST be a Fortran CHARACTER variable or constant.

out: INTEGER\*4 var num

The zVariable number.

The only required preselected object/state is the current CDF.

#### <GET ,zVAR NUMDIMS >

Inquires the number of dimensions for the current zVariable in the current CDF. Required arguments are as follows:

out: INTEGER\*4 num dims

Number of dimensions.

The required preselected objects/states are the current CDF and its current zVariable.

#### <GET ,zVAR NUMELEMS >

Inquires the number of elements (of the data type) for the current zVariable (in the current CDF). Required arguments are as follows:

out: INTEGER\*4 num\_elements

Number of elements of the data type at each value. For character data types (CDF\_CHAR and CDF\_UCHAR) this is the number of characters in the string. (Each value consists of the entire string.) For all other data types this will always be one (1) – multiple elements at each value are not allowed for non-character data types.

The required preselected objects/states are the current CDF and its current zVariable.

## <GET ,zVAR NUMRECS >

Inquires the number of records written for the current zVariable (in the current CDF). This may not correspond to the maximum record written (see <GET\_,zVAR\_MAXREC\_>) if the zVariable has sparse records. Required arguments are as follows:

out: INTEGER\*4 num\_records

Number of records written.

The required preselected objects/states are the current CDF and its current zVariable.

## <GET ,zVAR PADVALUE >

Inquires the pad value of the current zVariable (in the current CDF). If a pad value has not been explicitly specified for the zVariable (see <PUT ,zVAR PADVALUE >), the informational status code

NO\_PADVALUE\_SPECIFIED will be returned and the default pad value for the zVariable's data type will be placed in the pad value buffer provided. Required arguments are as follows:

```
out: <type> value
```

Pad value. This buffer must be large to hold the value. <type> is dependent on the data type of the zVariable. The value is read from the CDF and placed into memory at address value.

**WARNING:** If the zVariable has one of the character data types (CDF\_CHAR or CDF\_UCHAR), then value must be a CHARACTER Fortran variable. If the zVariable does not have one of the character data types, then value must NOT be a CHARACTER Fortran variable.

The required preselected objects/states are the current CDF and its current zVariable.

#### <GET ,zVAR RECVARY >

Inquires the record variance of the current zVariable (in the current CDF). Required arguments are as follows:

```
out: INTEGER*4 rec vary
```

Record variance. The variances are described in Section 4.9.

The required preselected objects/states are the current CDF and its current zVariable.

#### <GET ,zVAR SEQDATA >

Reads one value from the current zVariable (in the current CDF) at the current sequential value for that zVariable. After the read the current sequential value is automatically incremented to the next value (crossing a record boundary If necessary). An error is returned if the current sequential value is past the last record for the zVariable. Required arguments are as follows:

```
out: <type> value
```

Value. This buffer must be large enough to hold the value. The value is read from the CDF and placed into memory at address value.

The required preselected objects/states are the current CDF, its current zVariable, and the current sequential value for the zVariable. Note that the current sequential value for a zVariable increments automatically as values are read.

#### <GET ,zVAR SPARSEARRAYS >

Inquires the sparse arrays type/parameters of the current zVariable (in the current CDF). Required arguments are as follows:

```
out: INTEGER*4 s arrays type
```

The sparse arrays type. The types of sparse arrays are described in Section 4.11.

```
out: INTEGER*4 a arrays parms(CDF MAX PARMS)
```

The sparse arrays parameters. The sparse arrays parameters are described in Section 4.11.

```
out: INTEGER*4 a arrays pct
```

If sparse arrays, the percentage of the non-sparse size of the zVariable's data values needed to store the sparse values.

The required preselected objects/states are the current CDF and its current zVariable.

#### <GET ,zVAR SPARSERECORDS >

Inquires the sparse records type of the current zVariable (in the current CDF). Required arguments are as follows:

out: INTEGER\*4 s records type

The sparse records type. The types of sparse records are described in Section 4.11.

The required preselected objects/states are the current CDF and its current zVariable.

#### <GET ,zVARs MAXREC >

Inquires the maximum record number of the zVariables in the current CDF. Note that this is not the number of records but rather the maximum record number (which is one less than the number of records). A value of negative one (-1) indicates that the zVariables contain no records. The maximum record number for an individual zVariable may be inquired using the <GET\_,zVAR\_MAXREC\_> operation. Required arguments are as follows:

out: INTEGER\*4 max\_rec

Maximum record number.

The only required preselected object/state is the current CDF.

#### <GET ,zVARs RECDATA >

Reads full-physical records from one or more zVariables (in the current CDF). The full-physical record for a particular zVariable is read at the current record number for that zVariable. (The record numbers do not have to be the same but in most cases probably will be.) This operation does not affect the current zVariable (in the current CDF). Required arguments are as follows:

in: INTEGER\*4 num\_vars

The number of zVariables from which to read. This must be at least one (1).

in: INTEGER\*4 var nums(\*)

The zVariables from which to read. This array, whose size is determined by the value of num\_vars, contains zVariable numbers. The zVariable numbers can be listed in any order.

in: <type> buffer

The buffer into which the full-physical zVariable records being read are to be placed. This buffer must be large enough to hold the full-physical records. <type> must be a Fortran variable that will be passed by reference and cannot be of type CHARACTER. (The CDF library is expecting an address at which to place the full-physical records being read.) The order of the full-physical zVariable records in this buffer will correspond to the zVariable numbers listed in varNums, and this buffer will be contiguous --- there will be no spacing between full-physical zVariable records. Be careful if using Fortran STRUCTUREs to receive multiple full-physical zVariable records. Fortran compilers on some operating systems will pad between the elements of a STRUCTURE in order to prevent memory alignment errors (i.e., the elements of a STRUCTURE may not be contiguous). See the Concepts chapter in the CDF User's Guide for more details on how to create this buffer.

The required preselected objects/states are the current CDF and the current record number for each of the zVariables specified. A convenience operation exists, <SELECT ,zVARs RECNUMBER >, that allows the

current record number for each zVariable to be selected at one time (as opposed to selecting the current record numbers one at a time using <SELECT ,zVAR RECNUMBER >). 14

#### <NULL >

Marks the end of the argument list that is passed to An internal interface call. No other arguments are allowed after it.

#### <OPEN ,CDF >

Opens the named CDF. The opened CDF implicitly becomes the current CDF. Required arguments are as follows:

#### in: CHARACTER CDF name\*(\*)

File name of the CDF to be opened. (Do not append an extension.) This can be at most CDF\_PATHNAME\_LEN characters. A CDF file name may contain disk and directory specifications that conform to the conventions of the operating system being used (including logical names on VMS systems and environment variables on UNIX systems).

**UNIX:** File names are case-sensitive.

**UNIX:** For the proper operation of CDF\_lib, CDF\_name MUST be a Fortran CHARACTER variable or constant.

out: INTEGER\*4 id

CDF identifier to be used in subsequent operations on the CDF.

There are no required preselected objects/states.

### <PUT ,ATTR NAME >

Renames the current attribute (in the current CDF). An attribute with the same name must not already exist in the CDF. Required arguments are as follows:

in: CHARACTER attr name\*(\*)

New attribute name. This may be at most CDF ATTR NAME LEN characters.

UNIX: For the proper operation of CDF\_lib, attr\_name MUST be a Fortran CHARACTER variable or constant.

The required preselected objects/states are the current CDF and its current attribute.

#### <PUT ,ATTR SCOPE >

Respecifies the scope for the current attribute (in the current CDF). Required arguments are as follows:

in: INTEGER\*4 scope

New attribute scope. Specify one of the scopes described in Section 4.12.

The required preselected objects/states are the current CDF and its current attribute.

## <PUT ,CDF COMPRESSION >

Specifies the compression type/parameters for the current CDF. This refers to the compression of the CDF - not of any variables. Required arguments are as follows:

<sup>&</sup>lt;sup>14</sup> A Standard Interface at Section 5.26 provides the same functionality.

#### in: INTEGER\*4 cType

The compression type. The types of compressions are described in Section 4.10.

### in: INTEGER\*4 c parms(\*)

The compression parameters. The compression parameters are described in Section 4.10.

The only required preselected object/state is the current CDF.

#### <PUT ,CDF ENCODING >

Respecifies the data encoding of the current CDF. A CDF's data encoding may not be changed after any variable values (including the pad value) or attribute entries have been written. Required arguments are as follows:

#### in: INTEGER\*4 encoding

New data encoding. Specify one of the encodings described in Section 4.6.

The only required preselected object/state is the current CDF.

### <PUT ,CDF FORMAT >

Respecifies the format of the current CDF. A CDF's format may not be changed after any variables have been created. Required arguments are as follows:

#### in: INTEGER\*4 format

New CDF format. Specify one of the formats described in Section 4.4.

The only required preselected object/state is the current CDF.

## <PUT ,CDF MAJORITY >

Respecifies the variable majority of the current CDF. A CDF's variable majority may not be changed after any variable values have been written. Required arguments are as follows:

#### in: INTEGER\*4 majority

New variable majority. Specify one of the majorities described in Section 4.8.

The only required preselected object/state is the current CDF.

## <PUT ,gENTRY DATA >

Writes a gEntry to the current attribute at the current gEntry number (in the current CDF). An existing gEntry may be overwritten with a new gEntry having the same data specification (data type and number of elements) or a different data specification. Required arguments are as follows:

#### in: INTEGER\*4 data type

Data type of the gEntry. Specify one of the data types described in Section 4.5.

#### in: INTEGER\*4 num elements

Number of elements of the data type. This may be greater than one (1) for any of the supported data types. For character data types (CDF\_CHAR and CDF\_UCHAR) this is the number of characters in the string (an array of characters). For all other data types this is the number of elements in an array of that data type.

in: <type> value

Value. <type> is dependent on the data type of the gEnrty. The value is written to the CDF from value.

**WARNING:** If the gEntry has one of the character data types (CDF\_CHAR or CDF\_UCHAR), then value must be a CHARACTER Fortran variable. If the gEntry does not have one of the character data types, then value must NOT be a CHARACTER Fortran variable.

The required preselected objects/states are the current CDF, its current attribute, and its current gEntry number.

**NOTE:** Only use this operation on gAttributes. An error will occur if used on a vAttribute.

#### <PUT ,gENTRY DATASPEC >

Modifies the data specification (data type and number of elements) of the gEntry at the current gEntry number of the current attribute (in the current CDF). The new and old data types must be equivalent, and the number of elements must not be changed. Equivalent data types are described in the Concepts chapter in the CDF User's Guide. Required arguments are as follows:

in: INTEGER\*4 data\_type

New data type of the gEntry. Specify one of the data types described in Section 4.5.

in: INTEGER\*4 num\_elements

Number of elements of the data type.

The required preselected objects/states are the current CDF, its current attribute, and its current gEntry number.

**NOTE:** Only use this operation on gAttributes. An error will occur if used on a vAttribute.

#### <PUT ,rENTRY DATA >

Writes an rEntry to the current attribute at the current rEntry number (in the current CDF). An existing rEntry may be overwritten with a new rEntry having the same data specification (data type and number of elements) or a different data specification. Required arguments are as follows:

in: INTEGER\*4 data\_type

Data type of the rEntry. Specify one of the data types described in Section 4.5.

in: INTEGER\*4 num\_elements

Number of elements of the data type. This may be greater than one (1) for any of the supported data types. For character data types (CDF\_CHAR and CDF\_UCHAR) this is the number of characters in the string (an array of characters). For all other data types this is the number of elements in an array of that data type.

in: <type> value

Value. <type> is dependent on the data type of the rEnrty. The value is written to the CDF from value.

**WARNING:** If the rEntry has one of the character data types (CDF\_CHAR or CDF\_UCHAR), then value must be a CHARACTER Fortran variable. If the rEntry does not have one of the character data types, then value must NOT be a CHARACTER Fortran variable.

The required preselected objects/states are the current CDF, its current attribute, and its current rEntry number.

**NOTE:** Only use this operation on vAttributes. An error will occur if used on a gAttribute.

#### <PUT ,rENTRY DATASPEC >

Modifies the data specification (data type and number of elements) of the rEntry at the current rEntry number of the current attribute (in the current CDF). The new and old data types must be equivalent, and the number of elements must not be changed. Equivalent data types are described in the Concepts chapter in the CDF User's Guide. Required arguments are as follows:

in: INTEGER\*4 data\_type

New data type of the rEntry. Specify one of the data types described in Section 4.5.

in: INTEGER\*4 num elements

Number of elements of the data type.

The required preselected objects/states are the current CDF, its current attribute, and its current rEntry number.

**NOTE:** Only use this operation on vAttributes. An error will occur if used on a gAttribute.

#### <PUT ,rVAR ALLOCATEBLOCK >

Specifies a range of records to allocate for the current rVariable (in the current CDF). This operation is only applicable to uncompressed rVariables in single-file CDFs. The Concepts chapter in the CDF User's Guide describes the allocation of variable records. Required arguments are as follows:

in: INTEGER\*4 first record

The first record number to allocate.

in: INTEGER\*4 last record

The last record number to allocate.

The required preselected objects/states are the current CDF and its current rVariable.

#### <PUT ,rVAR ALLOCATERECS >

Specifies the number of records to allocate for the current rVariable (in the current CDF). The records are allocated beginning at record number 0 (zero). This operation is only applicable to uncompressed rVariables in single-file CDFs. The Concepts chapter in the CDF User's Guide describes the allocation of variable records. Required arguments are as follows:

in: INTEGER\*4 num\_records

Number of records to allocate.

The required preselected objects/states are the current CDF and its current rVariable.

<PUT ,rVAR BLOCKINGFACTOR >15

<sup>&</sup>lt;sup>15</sup> The item rVAR BLOCKINGFACTOR was previously named rVAR EXTENDRECS.

Specifies the blocking factor for the current rVariable (in the current CDF). The Concepts chapter in the CDF User's Guide describes a variable's blocking factor. **NOTE:** The blocking factor has no effect for NRV variables or multi-file CDFs. Required arguments are as follows:

in: INTEGER\*4 blockingFactor

The blocking factor. A value of zero (0) indicates that the default blocking factor should be used.

The required preselected objects/states are the current CDF and its current rVariable.

#### <PUT ,rVAR COMPRESSION >

Specifies the compression type/parameters for the current rVariable (in current CDF). Required arguments are as follows:

in: INTEGER\*4 cType

The compression type. The types of compressions are described in Section 4.10.

in: INTEGER\*4 c parms(\*)

The compression parameters. The compression parameters are described in Section 4.10.

The required preselected objects/states are the current CDF and its current rVariable.

#### <PUT ,rVAR DATA >

Writes one value to the current rVariable (in the current CDF). The value is written at the current record number and current dimension indices for the rVariables (in the current CDF). Required arguments are as follows:

in: <type> value

Value. <type> is dependent on the data type of the rVariable. The value is written to the CDF from value.

**WARNING:** If the rVariable has one of the character data types (CDF\_CHAR or CDF\_UCHAR), then value must be a CHARACTER Fortran variable. If the rVariable does not have one of the character data types, then value must NOT be a CHARACTER Fortran variable.

The required preselected objects/states are the current CDF, its current rVariable, its current record number for rVariables, and its current dimension indices for rVariables.

#### <PUT ,rVAR DATASPEC >

Respecifies the data specification (data type and number of elements) of the current rVariable (in the current CDF). An rVariable's data specification may not be changed If the new data specification is not equivalent to the old data specification and any values (including the pad value) have been written. Data specifications are considered equivalent If the data types are equivalent (see the Concepts chapter in the CDF User's Guide) and the number of elements are the same. Required arguments are as follows:

in: INTEGER\*4 data type

New data type. Specify one of the data types described in Section 4.5.

in: INTEGER\*4 num\_elements

Number of elements of the data type at each value. For character data types (CDF\_CHAR and CDF UCHAR), this is the number of characters in each string (an array of characters). A string exists

at each value. For the non-character data types this must be one (1) - arrays of values are not allowed for non-character data types.

The required preselected objects/states are the current CDF and its current rVariable.

#### <PUT ,rVAR DIMVARYS >

Respecifies the dimension variances of the current rVariable (in the current CDF). An rVariable's dimension variances may not be changed if any values have been written (except for an explicit pad value - it may have been written). For 0-dimensional rVariables this operation is not applicable. Required arguments are as follows:

```
in: INTEGER*4 dim varys(*)
```

New dimension variances. Each element of dim\_varys specifies the corresponding dimension variance. For each dimension specify one of the variances described in Section 4.9.

The required preselected objects/states are the current CDF and its current rVariable.

#### <PUT ,rVAR HYPERDATA >

Writes one or more values to the current rVariable (in the current CDF). The values are written based on the current record number, current record count, current record interval, current dimension indices, current dimension counts, and current dimension intervals for the rVariables (in the current CDF). Required arguments are as follows:

```
in: <type> buffer
```

Value. <type> is dependent on the data type of the rVariable. The values in buffer are written to the CDF.

**WARNING:** If the rVariable has one of the character data types (CDF\_CHAR or CDF\_UCHAR), then value must be a CHARACTER Fortran variable. If the rVariable does not have one of the character data types, then value must NOT be a CHARACTER Fortran variable.

The required preselected objects/states are the current CDF, its current rVariable, its current record number, record count, and record interval for rVariables, and its current dimension indices, dimension counts, and dimension intervals for rVariables.

#### <PUT ,rVAR INITIALRECS >

Specifies the number of records to initially write to the current rVariable (in the current CDF). The records are written beginning at record number 0 (zero). This may be specified only once per rVariable and before any other records have been written to that rVariable. If a pad value has not yet been specified, the default is used (see the Concepts chapter in the CDF User's Guide). If a pad value has been explicitly specified, that value is written to the records. The Concepts chapter in the CDF User's Guide describes initial records. Required arguments are as follows:

in: INTEGER\*4 num records

Number of records to write.

The required preselected objects/states are the current CDF and its current rVariable.

#### <PUT\_,rVAR\_NAME >

Renames the current rVariable (in the current CDF). A variable (rVariable or zVariable) with the same name must not already exist in the CDF. Required arguments are as follows:

in: CHARACTER var name\*(\*)

New name of the rVariable. This may consist of at most CDF VAR NAME LEN characters.

UNIX: For the proper operation of CDF\_lib, var\_name MUST be a Fortran CHARACTER variable or constant.

The required preselected objects/states are the current CDF and its current rVariable.

#### <PUT ,rVAR PADVALUE >

Specifies the pad value for the current rVariable (in the current CDF). An rVariable's pad value may be specified (or respecified) at any time without affecting already written values (including where pad values were used). The Concepts chapter in the CDF User's Guide describes variable pad values. Required arguments are as follows:

in: <type> value

Pad value. <type> is dependent on the data type of the rVariable. The pad value is written to the CDF from value.

**WARNING:** If the rVariable has one of the character data types (CDF\_CHAR or CDF\_UCHAR), then value must be a CHARACTER Fortran variable. If the rVariable does not have one of the character data types, then value must NOT be a CHARACTER Fortran variable.

The required preselected objects/states are the current CDF and its current rVariable.

#### <PUT ,rVAR RECVARY >

Respecifies the record variance of the current rVariable (in the current CDF). An rVariable's record variance may not be changed if any values have been written (except for an explicit pad value - it may have been written). Required arguments are as follows:

in: INTEGER\*4 rec vary

New record variance. Specify one of the variances described in Section 4.9.

The required preselected objects/states are the current CDF and its current rVariable.

#### <PUT ,rVAR SEQDATA >

Writes one value to the current rVariable (in the current CDF) at the current sequential value for that rVariable. After the write the current sequential value is automatically incremented to the next value (crossing a record boundary if necessary). If the current sequential value is past the last record for the rVariable, the rVariable is extended as necessary. Required arguments are as follows:

in: <type> value

Value. <type> is dependent on the data type of the rVariable. The value is written to the CDF from value.

**WARNING:** If the rVariable has one of the character data types (CDF\_CHAR or CDF\_UCHAR), then value must be a CHARACTER Fortran variable. If the rVariable does not have one of the character data types, then value must NOT be a CHARACTER Fortran variable.

The required preselected objects/states are the current CDF, its current rVariable, and the current sequential value for the rVariable. Note that the current sequential value for an rVariable increments automatically as values are written.

<PUT ,rVAR SPARSEARRAYS >

Specifies the sparse arrays type/parameters for the current rVariable (in the current CDF). Required arguments are as follows:

in: INTEGER\*4 s\_arrays\_type

The sparse arrays type. The types of sparse arrays are described in Section 4.11.

in: INTEGER\*4 a arrays parms(\*)

The sparse arrays parameters. The sparse arrays parameters are described in Section 4.11.

The required preselected objects/states are the current CDF and its current rVariable.

#### <PUT ,rVAR SPARSERECORDS >

Specifies the sparse records type for the current rVariable (in the current CDF). Required arguments are as follows:

in: INTEGER\*4 s records type

The sparse records type. The types of sparse records are described in Section 4.11.

The required preselected objects/states are the current CDF and its current rVariable.

#### <PUT ,rVARs RECDATA >

Writes full-physical records to one or more rVariables (in the current CDF). The full-physical records are written at the current record number for rVariables. This operation does not affect the current rVariable (in the current CDF). Required arguments are as follows:

in: INTEGER\*4 num\_vars

The number of rVariables to which to write. This must be at least one (1).

in: INTEGER\*4 var\_nums(\*)

The rVariables to which to write. This array, whose size is determined by the value of num\_vars, contains rVariable numbers. The rVariable numbers can be listed in any order.

in: <type> buffer

The buffer of full-physical rVariable records to be written. <type> must be a Fortran variable that will be passed by reference and cannot be of type CHARACTER. (The CDF library is expecting an address at which to get the full-physical records being written.) The order of the full-physical rVariable records in this buffer must agree with the rVariable numbers listed in varNums and this buffer must be contiguous --- there can be no spacing between full-physical rVariable records. Be careful if using Fortran STRUCTUREs to store multiple full-physical rVariable records. Fortran compilers on some operating systems will pad between the elements of a STRUCTURE in order to prevent memory alignment errors (i.e., the elements of a STRUCTURE may not be contiguous). See the Concepts chapter in the CDF User's Guide for more details on how to create this buffer.

The required preselected objects/states are the current CDF and its current record number for rVariables. <sup>16</sup>

<PUT\_,zENTRY\_DATA\_>

<sup>&</sup>lt;sup>16</sup> A Standard Interface at Section 5.25 provides the same functionality.

Writes a zEntry to the current attribute at the current zEntry number (in the current CDF). An existing zEntry may be overwritten with a new zEntry having the same data specification (data type and number of elements) or a different data specification. Required arguments are as follows:

in: INTEGER\*4 data type

Data type of the zEntry. Specify one of the data types described in Section 4.5.

in: INTEGER\*4 num elements

Number of elements of the data type. This may be greater than one (1) for any of the supported data types. For character data types (CDF\_CHAR and CDF\_UCHAR) this is the number of characters in the string (an array of characters). For all other data types this is the number of elements in an array of that data type.

in: <type> value

The value(s). <type> depends on the data type of the zEntry. The value is written to the CDF from value.

**WARNING:** If the zEntry has one of the character data types (CDF\_CHAR or CDF\_UCHAR), then value must be a CHARACTER Fortran variable. If the zEntry does not have one of the character data types, then value must NOT be a CHARACTER Fortran variable.

The required preselected objects/states are the current CDF, its current attribute, and its current zEntry number.

**NOTE:** Only use this operation on vAttributes. An error will occur if used on a gAttribute.

#### <PUT ,zENTRY DATASPEC >

Modifies the data specification (data type and number of elements) of the zEntry at the current zEntry number of the current attribute (in the current CDF). The new and old data types must be equivalent, and the number of elements must not be changed. Equivalent data types are described in the Concepts chapter in the CDF User's Guide. Required arguments are as follows:

in: INTEGER\*4 data type

New data type of the zEntry. Specify one of the data types described in Section 4.5.

in: INTEGER\*4 num elements

Number of elements of the data type.

The required preselected objects/states are the current CDF, its current attribute, and its current zEntry number.

**NOTE:** Only use this operation on vAttributes. An error will occur if used on a gAttribute.

#### <PUT ,zVAR ALLOCATEBLOCK >

Specifies a range of records to allocate for the current zVariable (in the current CDF). This operation is only applicable to uncompressed zVariables in single-file CDFs. The Concepts chapter in the CDF User's Guide describes the allocation of variable records. Required arguments are as follows:

in: INTEGER\*4 first record

The first record number to allocate.

#### in: INTEGER\*4 last record

The last record number to allocate.

The required preselected objects/states are the current CDF and its current zVariable.

#### <PUT ,zVAR ALLOCATERECS >

Specifies the number of records to allocate for the current zVariable (in the current CDF). The records are allocated beginning at record number 0 (zero). This operation is only applicable to uncompressed zVariables in single-file CDFs. The Concepts chapter in the CDF User's Guide describes the allocation of variable records. Required arguments are as follows:

#### in: INTEGER\*4 num\_records

Number of records to allocate.

The required preselected objects/states are the current CDF and its current zVariable.

#### <PUT ,zVAR BLOCKINGFACTOR >17

Specifies the blocking factor for the current zVariable (in the current CDF). The Concepts chapter in the CDF User's Guide describes a variable's blocking factor. **NOTE:** The blocking factor has no effect for NRV variables or multi-file CDFs. Required arguments are as follows:

#### in: INTEGER\*4 blockingFactor

The blocking factor. A value of zero (0) indicates that the default blocking factor should be used.

The required preselected objects/states are the current CDF and its current zVariable.

#### <PUT ,zVAR COMPRESSION >

Specifies the compression type/parameters for the current zVariable (in current CDF). Required arguments are as follows:

#### in: INTEGER\*4 cType

The compression type. The types of compressions are described in Section 4.10.

#### in: INTEGER\*4 c\_parms(\*)

The compression parameters. The compression parameters are described in Section 4.10.

The required preselected objects/states are the current CDF and its current zVariable.

#### <PUT ,zVAR DATA >

Writes one value to the current zVariable (in the current CDF). The value is written at the current record number and current dimension indices for that zVariable (in the current CDF). Required arguments are as follows:

#### in: <type> value

Value. <type> is dependent on the data type of the zVariable. The value is written to the CDF from value.

 $<sup>^{\</sup>rm 17}$  The item <code>zVAR\_BLOCKINGFACTOR</code> was previously named <code>zVAR\_EXTENDRECS</code> .

**WARNING:** If the zVariable has one of the character data types (CDF\_CHAR or CDF\_UCHAR), then value must be a CHARACTER Fortran variable. If the zVariable does not have one of the character data types, then value must NOT be a CHARACTER Fortran variable.

The required preselected objects/states are the current CDF, its current zVariable, the current record number for the zVariable, and the current dimension indices for the zVariable.

#### <PUT ,zVAR DATASPEC >

Respecifies the data specification (data type and number of elements) of the current zVariable (in the current CDF). A zVariable's data specification may not be changed If the new data specification is not equivalent to the old data specification and any values (including the pad value) have been written. Data specifications are considered equivalent If the data types are equivalent (see the Concepts chapter in the CDF User's Guide) and the number of elements are the same. Required arguments are as follows:

in: INTEGER\*4 data type

New data type. Specify one of the data types described in Section 4.5.

in: INTEGER\*4 num elements

Number of elements of the data type at each value. For character data types (CDF\_CHAR and CDF\_UCHAR), this is the number of characters in each string (an array of characters). A string exists at each value. For the non-character data types this must be one (1) - arrays of values are not allowed for non-character data types.

The required preselected objects/states are the current CDF and its current zVariable.

#### <PUT ,zVAR DIMVARYS >

Respecifies the dimension variances of the current zVariable (in the current CDF). A zVariable's dimension variances may not be changed if any values have been written (except for an explicit pad value - it may have been written). For 0-dimensional zVariables this operation is not applicable. Required arguments are as follows:

in: INTEGER\*4 dim varys(\*)

New dimension variances. Each element of dim\_varys specifies the corresponding dimension variance. For each dimension specify one of the variances described in Section 4.9.

The required preselected objects/states are the current CDF and its current zVariable.

#### <PUT ,zVAR INITIALRECS >

Specifies the number of records to initially write to the current zVariable (in the current CDF). The records are written beginning at record number 0 (zero). This may be specified only once per zVariable and before any other records have been written to that zVariable. If a pad value has not yet been specified, the default is used (see the Concepts chapter in the CDF User's Guide). If a pad value has been explicitly specified, that value is written to the records. The Concepts chapter in the CDF User's Guide describes initial records. Required arguments are as follows:

in: INTEGER\*4 num\_records

Number of records to write

The required preselected objects/states are the current CDF and its current zVariable.

<PUT ,zVAR HYPERDATA >

Writes one or more values to the current zVariable (in the current CDF). The values are written based on the current record number, current record count, current record interval, current dimension indices, current dimension counts, and current dimension intervals for that zVariable (in the current CDF). Required arguments are as follows:

in: <type> buffer

Value. <type> is dependent on the data type of the zVariable. The value is written to the CDF from value.

**WARNING:** If the zVariable has one of the character data types (CDF\_CHAR or CDF\_UCHAR), then value must be a CHARACTER Fortran variable. If the zVariable does not have one of the character data types, then value must NOT be a CHARACTER Fortran variable.

The required preselected objects/states are the current CDF, its current zVariable, the current record number, record count, and record interval for the zVariable, and the current dimension indices, dimension counts, and dimension intervals for the zVariable.

#### <PUT ,zVAR NAME >

Renames the current zVariable (in the current CDF). A variable (rVariable or zVariable) with the same name must not already exist in the CDF. Required arguments are as follows:

in: CHARACTER var name\*(\*)

New name of the zVariable. This may consist of at most CDF VAR NAME LEN characters.

The required preselected objects/states are the current CDF and its current zVariable.

#### <PUT ,zVAR PADVALUE >

Specifies the pad value for the current zVariable (in the current CDF). A zVariable's pad value may be specified (or respecified) at any time without affecting already written values (including where pad values were used). The Concepts chapter in the CDF User's Guide describes variable pad values. Required arguments are as follows:

in: <type> value

Pad value. <type> is dependent on the data type of the zVariable. The value is written to the CDF from value.

**WARNING:** If the zVariable has one of the character data types (CDF\_CHAR or CDF\_UCHAR), then value must be a CHARACTER Fortran variable. If the zVariable does not have one of the character data types, then value must NOT be a CHARACTER Fortran variable.

The required preselected objects/states are the current CDF and its current zVariable.

#### <PUT ,zVAR RECVARY >

Respecifies the record variance of the current zVariable (in the current CDF). A zVariable's record variance may not be changed if any values have been written (except for an explicit pad value - it may have been written). Required arguments are as follows:

in: INTEGER\*4 rec vary

New record variance. Specify one of the variances described in Section 4.9.

The required preselected objects/states are the current CDF and its current zVariable.

#### <PUT ,zVAR SEQDATA >

Writes one value to the current zVariable (in the current CDF) at the current sequential value for that zVariable. After the write the current sequential value is automatically incremented to the next value (crossing a record boundary if necessary). If the current sequential value is past the last record for the zVariable, the zVariable is extended as necessary. Required arguments are as follows:

in: <type> value

Value. <type> is dependent on the data type of the zVariable. The value is written to the CDF from value.

**WARNING:** If the zVariable has one of the character data types (CDF\_CHAR or CDF\_UCHAR), then value must be a CHARACTER Fortran variable. If the zVariable does not have one of the character data types, then value must NOT be a CHARACTER Fortran variable.

The required preselected objects/states are the current CDF, its current zVariable, and the current sequential value for the zVariable. Note that the current sequential value for a zVariable increments automatically as values are written.

#### <PUT ,zVAR SPARSEARRAYS >

Specifies the sparse arrays type/parameters for the current zVariable (in the current CDF). Required arguments are as follows:

in: INTEGER\*4 s arrays type

The sparse arrays type. The types of sparse arrays are described in Section 4.11.

in: INTEGER\*4 a arrays parms(\*)

The sparse arrays parameters. The sparse arrays parameters are described in Section 4.11.

The required preselected objects/states are the current CDF and its current zVariable.

#### <PUT ,zVAR SPARSERECORDS >

Specifies the sparse records type for the current zVariable (in the current CDF). Required arguments are as follows:

in: INTEGER\*4 s\_records\_type

The sparse records type. The types of sparse records are described in Section 4.11.

The required preselected objects/states are the current CDF and its current zVariable.

#### <PUT ,zVARs RECDATA >

Writes full-physical records to one or more zVariables (in the current CDF). The full-physical record for a particular zVariable is written at the current record number for that zVariable. (The record numbers do not have to be the same but in most cases probably will be.) This operation does not affect the current zVariable (in the current CDF). Required arguments are as follows:

in: INTEGER\*4 num vars

The number of zVariables to which to write. This must be at least one (1).

in: INTEGER\*4 var nums(\*)

The zVariables to which to write. This array, whose size is determined by the value of num\_vars, contains zVariable numbers. The zVariable numbers can be listed in any order.

in: <type> buffer

The buffer of full-physical zVariable records to be written. <type> must be a Fortran variable that will be passed by reference and cannot be of type CHARACTER. (The CDF library is expecting an address at which to get the full-physical records being written.) The order of the full-physical zVariable records in this buffer must agree with the zVariable numbers listed in varNums and this buffer must be contiguous --- there can be no spacing between full-physical zVariable records. Be careful if using Fortran STRUCTUREs to store multiple full-physical zVariable records. Fortran compilers on some operating systems will pad between the elements of a STRUCTURE in order to prevent memory alignment errors (i.e., the elements of a STRUCTURE may not be contiguous). See the Concepts chapter in the CDF User's Guide for more details on how to create this buffer.

The required preselected objects/states are the current CDF and the current record number for each of the zVariables specified. A convenience operation exists, <SELECT\_,zVARs\_RECNUMBER\_>, that allows the current record number for each zVariable to be selected at one time (as opposed to selecting the current record numbers one at a time using <SELECT\_,zVAR\_RECNUMBER\_>).

<SELECT ,ATTR >

Explicitly selects the current attribute (in the current CDF) by number. Required arguments are as follows:

in: INTEGER\*4 attr num

Attribute number.

The only required preselected object/state is the current CDF.

<SELECT ,ATTR NAME >

Explicitly selects the current attribute (in the current CDF) by name. **NOTE:** Selecting the current attribute by number (see <SELECT,ATTR >) is more e cient. Required arguments are as follows:

in: CHARACTER attr name\*(\*)

Attribute name. This may be at most CDF ATTR NAME LEN characters.

UNIX: For the proper operation of CDF\_lib, attr\_name MUST be a Fortran CHARACTER variable or constant.

The only required preselected object/state is the current CDF.

<SELECT ,CDF >

Explicitly selects the current CDF. Required arguments are as follows:

in: INTEGER\*4 id

Identifier of the CDF. This identifier must have been initialized by a successful <CREATE\_,CDF\_> or <OPEN ,CDF\_> operation.

There are no required preselected objects/states.

<SELECT\_,CDF\_CACHESIZE\_>

<sup>&</sup>lt;sup>18</sup> A Standard Interface at Section 5.27 provides the same functionality.

Selects the number of cache buffers to be used for the dotCDF file (for the current CDF). The Concepts chapter in the CDF User's Guide describes the caching scheme used by the CDF library. Required arguments are as follows:

in: INTEGER\*4 num buffers

The number of cache buffers to be used.

The only required preselected object/state is the current CDF.

#### <SELECT ,CDF DECODING >

Selects a decoding (for the current CDF). Required arguments are as follows:

in: INTEGER\*4 decoding

The decoding. Specify one of the decodings described in Section 4.7.

The only required preselected object/state is the current CDF.

#### <SELECT ,CDF NEGtoPOSfp0 MODE >

Selects a -0.0 to 0.0 mode (for the current CDF). Required arguments are as follows:

in: INTEGER\*4 mode

The -0.0 to 0.0 mode. Specify one of the -0.0 to 0.0 modes described in Section 4.15.

The only required preselected object/state is the current CDF.

#### <SELECT ,CDF READONLY MODE >

Selects a read-only mode (for the current CDF). Required arguments are as follows:

in: INTEGER\*4 mode

The read-only mode. Specify one of the read-only modes described in Section 4.13.

The only required preselected object/state is the current CDF.

#### <SELECT\_,CDF\_SCRATCHDIR\_>

Selects a directory to be used for scratch files (by the CDF library) for the current CDF. The Concepts chapter in the CDF User's Guide describes how the CDF library uses scratch files. This scratch directory will override the directory specified by the the CDF\$TMP logical name (on VMS systems) or CDF TMP environment variable (on UNIX and MS-DOS systems). Required arguments are as follows:

in: CHARACTER scratch dir\*(\*)

The directory to be used for scratch files. The length of this directory specification is limited only by the operating system being used.

**UNIX:** For the proper operation of CDF\_lib, scratch\_dir MUST be a Fortran CHARACTER variable or constant.

The only required preselected object/state is the current CDF.

#### <SELECT ,CDF STATUS >

Selects the current status code. Required arguments are as follows:

#### in: INTEGER\*4 status

CDF status code.

There are no required preselected objects/states.

#### <SELECT ,CDF zMODE >

Selects a zMode (for the current CDF). Required arguments are as follows:

in: INTEGER\*4 mode

The zMode. Specify one of the zModes described in Section 4.14.

The only required preselected object/state is the current CDF.

#### <SELECT ,COMPRESS CACHESIZE >

Selects the number of cache buffers to be used for the compression scratch file (for the current CDF). The Concepts chapter in the CDF User's Guide describes the caching scheme used by the CDF library. Required arguments are as follows:

in: INTEGER\*4 num\_buffers

The number of cache buffers to be used.

The only required preselected object/state is the current CDF.

#### <SELECT ,gENTRY >

Selects the current gEntry number for all gAttributes in the current CDF. Required arguments are as follows:

in: INTEGER\*4 entry num

gEntry number.

The only required preselected object/state is the current CDF.

#### <SELECT ,rENTRY >

Selects the current rEntry number for all vAttributes in the current CDF. Required arguments are as follows:

in: INTEGER\*4 entry num

rEntry number.

The only required preselected object/state is the current CDF.

#### <SELECT\_,rENTRY\_NAME\_>

Selects the current rEntry number for all vAttributes (in the current CDF) by rVariable name. The number of the named rVariable becomes the current rEntry number. (The current rVariable is not changed.) **NOTE:** Selecting the current rEntry by number (see <SELECT, rENTRY >) is more e cient. Required arguments are as follows:

in: CHARACTER var name\*(\*)

rVariable name. This may be at most CDF\_VAR\_NAME\_LEN characters.

**UNIX:** For the proper operation of CDF\_lib, var\_name MUST be a Fortran CHARACTER variable or constant.

The only required preselected object/state is the current CDF.

#### <SELECT ,rVAR >

Explicitly selects the current rVariable (in the current CDF) by number. Required arguments are as follows:

in: INTEGER\*4 var num

rVariable number.

The only required preselected object/state is the current CDF.

#### <SELECT ,rVAR CACHESIZE >

Selects the number of cache buffers to be used for the current rVariable's file (of the current CDF). This operation is not applicable to a single-file CDF. The Concepts chapter in the CDF User's Guide describes the caching scheme used by the CDF library. Required arguments are as follows:

in: INTEGER\*4 num buffers

The number of cache buffers to be used.

The required preselected objects/states are the current CDF and its current rVariable.

#### <SELECT ,rVAR NAME >

Explicitly selects the current rVariable (in the current CDF) by name. **NOTE:** Selecting the current rVariable by number (see <SELECT ,rVAR >) is more e cient. Required arguments are as follows:

in: CHARACTER var name\*(\*)

rVariable name. This may be at most CDF\_VAR\_NAME\_LEN characters.

**UNIX:** For the proper operation of CDF\_lib, var\_name MUST be a Fortran CHARACTER variable or constant.

The only required preselected object/state is the current CDF.

#### <SELECT .rVAR RESERVEPERCENT >

Selects the reserve percentage to be used for the current rVariable (in the current CDF). This operation is only applicable to compressed rVariables. The Concepts chapter in the CDF User's Guide describes the reserve percentage scheme used by the CDF library. Required arguments are as follows:

in: INTEGER\*4 percent

The reserve percentage.

The required preselected objects/states are the current CDF and its current rVariable.

#### <SELECT ,rVAR SEOPOS >

Selects the current sequential value for sequential access for the current rVariable (in the current CDF). Note that a current sequential value is maintained for each rVariable individually. Required arguments are as follows:

in: INTEGER\*4 rec num

Record number.

in: INTEGER\*4 indices(\*)

Dimension indices. Each element of indices specifies the corresponding dimension index. For 0-dimensional rVariables this argument is ignored (but must be present).

The required preselected objects/states are the current CDF and its current rVariable.

#### <SELECT ,rVARs CACHESIZE >

Selects the number of cache buffers to be used for all of the rVariable files (of the current CDF). This operation is not applicable to a single-file CDF. The Concepts chapter in the CDF User's Guide describes the caching scheme used by the CDF library. Required arguments are as follows:

in: INTEGER\*4 num\_buffers

The number of cache buffers to be used.

The only required preselected object/state is the current CDF.

#### <SELECT ,rVARs DIMCOUNTS >

Selects the current dimension counts for all rVariables in the current CDF. For 0-dimensional rVariables this operation is not applicable. Required arguments are as follows:

in: INTEGER\*4 counts(\*)

Dimension counts. Each element of counts specifies the corresponding dimension count.

The only required preselected object/state is the current CDF.

#### <SELECT ,rVARs DIMINDICES >

Selects the current dimension indices for all rVariables in the current CDF. For 0-dimensional rVariables this operation is not applicable. Required arguments are as follows:

in: INTEGER\*4 indices(\*)

Dimension indices. Each element of indices specifies the corresponding dimension index.

The only required preselected object/state is the current CDF.

#### <SELECT ,rVARs DIMINTERVALS >

Selects the current dimension intervals for all rVariables in the current CDF. For 0-dimensional rVariables this operation is not applicable. Required arguments are as follows:

in: INTEGER\*4 intervals(\*)

Dimension intervals. Each element of intervals specifies the corresponding dimension interval.

The only required preselected object/state is the current CDF.

#### <SELECT ,rVARs RECCOUNT >

Selects the current record count for all rVariables in the current CDF. Required arguments are as follows:

in: INTEGER\*4 rec count

Record count.

The only required preselected object/state is the current CDF.

<SELECT\_,rVARs\_RECINTERVAL\_>

Selects the current record interval for all rVariables in the current CDF. Required arguments are as follows:

in: INTEGER\*4 rec interval

Record interval.

The only required preselected object/state is the current CDF.

#### <SELECT ,rVARs RECNUMBER >

Selects the current record number for all rVariables in the current CDF. Required arguments are as follows:

in: INTEGER\*4 rec num

Record number.

The only required preselected object/state is the current CDF.

#### <SELECT ,STAGE CACHESIZE >

Selects the number of cache buffers to be used for the staging scratch file (for the current CDF). The Concepts chapter in the CDF User's Guide describes the caching scheme used by the CDF library. Required arguments are as follows:

in: INTEGER\*4 num buffers

The number of cache buffers to be used.

The only required preselected object/state is the current CDF.

#### <SELECT ,zENTRY >

Selects the current zEntry number for all vAttributes in the current CDF. Required arguments are as follows:

in: INTEGER\*4 entry\_num

zEntry number.

The only required preselected object/state is the current CDF.

#### <SELECT\_,zENTRY\_NAME\_>

Selects the current zEntry number for all vAttributes (in the current CDF) by zVariable name. The number of the named zVariable becomes the current zEntry number. (The current zVariable is not changed.) **NOTE:** Selecting the current zEntry by number (see <SELECT\_,zENTRY\_>) is more e\_cient. Required arguments are as follows:

in: CHARACTER var\_name\*(\*)

zVariable name. This may be at most CDF\_VAR\_NAME\_LEN characters.

**UNIX:** For the proper operation of CDF\_lib, var\_name MUST be a Fortran CHARACTER variable or constant.

The only required preselected object/state is the current CDF.

#### <SELECT\_,zVAR\_>

Explicitly selects the current zVariable (in the current CDF) by number. Required arguments are as follows:

in: INTEGER\*4 var\_num

zVariable number.

The only required preselected object/state is the current CDF.

#### <SELECT ,zVAR CACHESIZE >

Selects the number of cache buffers to be used for the current zVariable's file (of the current CDF). This operation is not applicable to a single-file CDF. The Concepts chapter in the CDF User's Guide describes the caching scheme used by the CDF library. Required arguments are as follows:

in: INTEGER\*4 num\_buffers

The number of cache buffers to be used.

The required preselected objects/states are the current CDF and its current zVariable.

#### <SELECT ,zVAR DIMCOUNTS >

Selects the current dimension counts for the current zVariable in the current CDF. For 0-dimensional zVariables this operation is not applicable. Required arguments are as follows:

in: INTEGER\*4 counts(\*)

Dimension counts. Each element of counts specifies the corresponding dimension count.

The required preselected objects/states are the current CDF and its current zVariable.

#### <SELECT\_,zVAR\_DIMINDICES\_>

Selects the current dimension indices for the current zVariable in the current CDF. For 0-dimensional zVariables this operation is not applicable. Required arguments are as follows:

in: INTEGER\*4 indices(\*)

Dimension indices. Each element of indices specifies the corresponding dimension index.

The required preselected objects/states are the current CDF and its current zVariable.

#### <SELECT ,zVAR DIMINTERVALS >

Selects the current dimension intervals for the current zVariable in the current CDF. For 0-dimensional zVariables this operation is not applicable. Required arguments are as follows:

in: INTEGER\*4 intervals(\*)

Dimension intervals. Each element of intervals specifies the corresponding dimension interval.

The required preselected objects/states are the current CDF and its current zVariable.

#### <SELECT ,zVAR NAME >

Explicitly selects the current zVariable (in the current CDF) by name. **NOTE:** Selecting the current zVariable by number (see <SELECT\_,zVAR\_>) is more e\_cient. Required arguments are as follows:

in: CHARACTER var name\*(\*)

zVariable name. This may be at most CDF\_VAR\_NAME\_LEN characters.

**UNIX:** For the proper operation of CDF\_lib, var\_name MUST be a Fortran CHARACTER variable or constant.

The only required preselected object/state is the current CDF.

#### <SELECT ,zVAR RECCOUNT >

Selects the current record count for the current zVariable in the current CDF. Required arguments are as follows:

in: INTEGER\*4 rec\_count

Record count.

The required preselected objects/states are the current CDF and its current zVariable.

#### <SELECT ,zVAR RECINTERVAL >

Selects the current record interval for the current zVariable in the current CDF. Required arguments are as follows:

in: INTEGER\*4 rec interval

Record interval.

The required preselected objects/states are the current CDF and its current zVariable.

#### <SELECT ,zVAR RECNUMBER >

Selects the current record number for the current zVariable in the current CDF. Required arguments are as follows:

in: INTEGER\*4 rec num

Record number.

The required preselected objects/states are the current CDF and its current zVariable.

#### <SELECT ,zVAR RESERVEPERCENT >

Selects the reserve percentage to be used for the current zVariable (in the current CDF). This operation is only applicable to compressed zVariables. The Concepts chapter in the CDF User's Guide describes the reserve percentage scheme used by the CDF library. Required arguments are as follows:

in: INTEGER\*4 percent

The reserve percentage.

The required preselected objects/states are the current CDF and its current zVariable.

#### <SELECT\_,zVAR\_SEQPOS\_>

Selects the current sequential value for sequential access for the current zVariable (in the current CDF). Note that a current sequential value is maintained for each zVariable individually. Required arguments are as follows:

in: INTEGER\*4 rec\_num

Record number.

in: INTEGER\*4 indices(\*)

Dimension indices. Each element of indices specifies the corresponding dimension index. For 0-dimensional zVariables this argument is ignored (but must be present).

The required preselected objects/states are the current CDF and its current zVariable.

#### <SELECT ,zVARs CACHESIZE >

Selects the number of cache buffers to be used for all of the zVariable files (of the current CDF). This operation is not applicable to a single-file CDF. The Concepts chapter in the CDF User's Guide describes the caching scheme used by the CDF library. Required arguments are as follows:

```
in: INTEGER*4 num_buffers
```

The number of cache buffers to be used.

The only required preselected object/state is the current CDF.

```
<SELECT ,zVARs RECNUMBER >
```

Selects the current record number for each zVariable in the current CDF. This operation is provided to simplify the selection of the current record numbers for the zVariables involved in a multiple variable access operation (see the Concepts chapter in the CDF User's Guide). Required arguments are as follows:

```
in: INTEGER*4 rec_num
```

Record number.

The only required preselected object/state is the current CDF.

## 6.7 More Examples

Several more examples of the use of CDF\_lib follow. in each example it is assumed that the current CDF has already been selected (either implicitly by creating/opening the CDF or explicitly with <SELECT\_,CDF\_>).

#### 6.7.1 rVariable Creation

In this example an rVariable will be created with a pad value being specified; initial records will be written; and the rVariable's blocking factor will be specified. Note that the pad value was specified before the initial records. This results in the specified pad value being written. Had the pad value not been specified first, the initial records would have been written with the default pad value. It is assumed that the current CDF has already been selected.

### 6.7.2 zVariable Creation (Character Data Type)

In this example a zVariable with a character data type will be created with a pad value being specified. It is assumed that the current CDF has already been selected.

```
INCLUDE '<path>CDF.INC'
INTEGER*4 status
                           ! Status returned from CDF library.
INTEGER*4 dim varys(1)
                         ! Dimension variances.
INTEGER*4 var num
                           ! zVariable number.
INTEGER*4 num dims
                           ! Number of dimension.
INTEGER*4 dim sizes(1)
                           ! Dimension sizes.
INTEGER*4 num elems
                          ! Number of elements (of the data type).
                          ! Pad value.
CHARACTER*10 pad value
DATA pad value/'*******/,
    num dims/1/,
    dim sizes/20/,
    num elems/10/
dim \ varys(1) = VARY
status = CDF_lib (CREATE_, zVAR_, 'Station', CDF_CHAR, num_elems, num_dims,
                                  dim sizes, NOVARY, dim varys, var num,
                  PUT , zVAR PADVALUE , pad value,
3
                 NULL_, status)
IF (status .NE. CDF OK) CALL UserStatusHandler (status)
```

# 6.7.3 Hyper Read with Subsampling

In this example an rVariable will be subsampled in a CDF whose rVariables are 2-dimensional and have dimension sizes [100,200]. The CDF is column major, and the data type of the rVariable is CDF\_UINT2. It is assumed that the current CDF has already been selected.

```
.
INCLUDE '<path>CDF.INC'
.
```

```
INTEGER*4 status ! Status returned from op: .

INTEGER*2 values(50,100) ! Buffer to receive values.
                                  ! Status returned from CDF library.
                                  ! Record count, one record per hyper get.
INTEGER*4 rec count
                               ! Record count, one record per nyper get.
! Record interval, set to one to indicate
INTEGER*4 rec interval
                                  ! contiguous records (really meaningless
                                  ! since record count is one).

                                  ! along each dimension will be read.
INTEGER*4 rec num
                                  ! Record number.
INTEGER*4 max rec
                                  ! Maximum rVariable record in the
                                   ! CDF - this was determined with a call
                                   ! to CDF inquire.
DATA rec count/1/, rec interval/1/, indices/1,1/, counts/50,100/,
  intervals/2,2/
status = CDF lib (SELECT , rVAR NAME , 'BRIGHTNESS',
                            rVARs RECCOUNT , rec count,
2
                            rVARs RECINTERVAL , rec interval,
3
                            rVARs_DIMINDICES_, indices,
4
                            rVARs DIMCOUNTS , counts,
                            rVARs DIMINTERVALS , intervals,
                  NULL , status)
IF (status .NE. CDF OK) CALL UserStatusHandler (status)
DO rec num = 1, max rec
  status = CDF lib (SELECT , rVARs RECNUMBER , rec num,
                     GET , rVAR HYPERDATA , values,
                      NULL , status)
   IF (status .NE. CDF OK) CALL UserStatusHandler (status)
       ! process values
END DO
```

#### 6.7.4 Attribute Renaming

In this example the attribute named Tmp will be renamed to TMP. It is assumed that the current CDF has already been selected.

```
.
INCLUDE '<path>CDF.INC'
.
```

#### 6.7.5 Sequential Access

In this example the values for a zVariable will be averaged. The values will be read using the sequential access method (see the Concepts chapter in the CDF User's Guide). Each value in each record will be read and averaged. It is assumed that the data type of the zVariable has been determined to be CDF\_REAL4. It is assumed that the current CDF has already been selected.

```
INCLUDE '<path>CDF.INC'
                        ! Status returned from CDF library.
INTEGER*4 status
INTEGER*4 var num
                          ! zVariable number.
INTEGER*4 rec_num
                           ! Record number, start at first record.
INTEGER*4 indices(2)
                          ! Dimension indices.
                           ! Value read.
REAL*4
       value
REAL*8
                          ! Sum of all values.
        sum
INTEGER*4 count
                          ! Number of values.
REAL*4
        ave
                           ! Average value.
DATA indices/1,1/, sum/0.0/, count/0/, rec num/1/
status = CDF_lib (GET_, zVAR_NUMBER_, 'FLUX', var_num,
                 NULL_, status)
IF (status .NE. CDF OK) CALL UserStatusHandler (status)
status = CDF lib (SELECT , zVAR , var num,
1
                           zVAR SEQPOS , rec num, indices,
2
                  GET , zVAR SEQDATA , value,
3
                  NULL , status)
DO WHILE (status .GE. CDF OK)
  sum = sum + value
  count = count + 1
  status = CDF lib (GET_, zVAR_SEQDATA_, value,
  1
                    NULL_, status)
END DO
IF (status .NE. END OF VAR) CALL UserStatusHandler (status)
ave = sum / count
```

.

#### 6.7.6 Attribute rEntry Writes

In this example a set of attribute rEntries for a particular rVariable will be written. It is assumed that the current CDF has already been selected.

```
INCLUDE '<path>CDF.INC'
INTEGER*4 status
                           ! Status returned from CDF library.
REAL*4
                           ! Scale, minimum/maximum.
        scale(2)
DATA scale/-90.0,90.0/
status = CDF lib (SELECT , rENTRY NAME , 'LATITUDE',
                           ATTR NAME , 'FIELDNAM',
                  PUT_, rENTRY_DATA_, CDF_CHAR, 20, 'Latitude',
3
                  SELECT , ATTR NAME , 'SCALE',
                  PUT , rENTRY DATA , CDF REAL4, 2, scale,
                  SELECT_, ATTR_NAME_, 'UNITS',
6
                  PUT_, rENTRY_DATA_, CDF_CHAR, 20, 'Degrees north',
7
                  NULL_, status)
IF (status .NE. CDF OK) CALL UserStatusHandler (status)
```

### 6.7.7 Multiple zVariable Write

In this example full-physical records will be written to the zVariables in a CDF. Note the ordering of the zVariables (see the Concepts chapter in the CDF User's Guide). It is assumed that the current CDF has already been selected.

```
INCLUDE '<path>CDF.INC'
INTEGER*4 status
                           ! Status returned from CDF library.
INTEGER*2 time
                           ! `Time' value.
         vector a(3)
                           ! `vectorA' values.
        vector_b(5)
                           ! `vectorB' values.
REAL*8
INTEGER*4 rec number
                           ! Record number.
         buffer(45)
                           ! Buffer of full-physical records.
INTEGER*4 var numbers(3)
                           ! Variable numbers.
EQUIVALENCE (vector b, buffer(1))
EQUIVALENCE (time, buffer(41))
EQUIVALENCE (vector a, buffer(43))
```

# Chapter 7

# Interpreting CDF Status Codes

Most CDF functions return a status code of type INTEGER\*4. The symbolic names for these codes are defined in cdf.inc and should be used in your applications rather than using the true numeric values. Appendix A explains each status code. When the status code returned from a CDF function is tested, the following rules apply.

status > CDF_OK	Indicates successful completion but some additional information is provided. These are informational codes.	
status = CDF_OK	Indicates successful completion.	
CDF_WARN < status < CDF_OK	Indicates that the function completed but probably not as expected. These are warning codes.	
status < CDF_WARN	Indicates that the function did not complete. These are error codes.	

The following example shows how you could check the status code returned from CDF functions.

In your own status handler you can take whatever action is appropriate to the application. An example status handler follows. Note that no action is taken in the status handler if the status is CDF OK.

```
INCLUDE '<path>cdf.inc'
SUBROUTINE UserStatusHandler (status)
INTEGER*4 status
CHARACTER message*(CDF_STATUSTEXT_LEN)
```

```
IF (status .LT. CDF WARN) THEN
       WRITE (6,10)
10
       FORMAT (' ','An error has occurred, halting...')
       CALL CDF error (status, message)
       WRITE (6,11) message
       FORMAT (' ',A)
11
       STOP
   ELSE
       IF (status .LT. CDF OK) THEN
          WRITE (6,12)
12
          FORMAT (' ','Warning, function may not have completed as expected...')
          CALL CDF error (status, message)
          WRITE (6,13) message
13
          FORMAT (' ',A)
       ELSE
          IF (status .GT. CDF OK) THEN
              WRITE (6,14)
14
              FORMAT (' ','Function completed successfully, but be advised that...')
              CALL CDF error (status, message)
              WRITE (6,15) message
15
              FORMAT (' ', A)
          END IF
       END IF
   END IF
   RETURN
   END
```

Explanations for all CDF status codes are available to your applications through the function CDF\_error. CDF\_error encodes in a text string an explanation of a given status code.

# Chapter 8

# **EPOCH Utility Routines**

Several subroutines exist that compute, decompose, parse, and encode CDF\_EPOCH and CDF\_EPOCH16 values. These functions may be called by applications using the CDF\_EPOCH and CDF\_EPOCH16 data types and are included in the CDF library. Function prototypes for these functions may be found in the include file cdf.h. The Concepts chapter in the CDF User's Guide describes EPOCH values.

The CDF\_EPOCH and CDF\_EPOCH16 data types are used to store time values referenced from a particular epoch. For CDF that epoch values for CDF\_EPOCH and CDF\_EPOCH16 are 01-Jan-0000 00:00:00.000.000 and 01-Jan-0000 00:00:00.000.000.000.000.000, respectively.

# 8.1 compute\_EPOCH

compute\_EPOCH calculates a CDF\_EPOCH value given the individual components. If an illegal component is detected, the value returned will be ILLEGAL EPOCH VALUE.

```
SUBROUTINE compute_EPOCH (
```

```
INTEGER*4 year,
                                  ! in -- Year (AD, e.g., 1994).
INTEGER*4 month,
                                  ! in -- Month (1-12).
INTEGER*4 day,
                                  ! in -- Day (1-31).
INTEGER*4 hour,
                                  ! in -- Hour (0-23).
                                  ! in -- Minute (0-59).
INTEGER*4 minute,
                                  ! in -- Second (0-59).
INTEGER*4 second,
                                  ! in -- Millisecond (0-999).
INTEGER*4 msec,
REAL*8
           epoch)
                                  ! out-- CDF EPOCH value
```

**NOTE:** There are two variations on how compute\_EPOCH may be used. If the month argument is 0 (zero), then the day argument is assumed to be the day of the year (DOY) having a range of 1 through 366. Also, if the hour, minute, and second arguments are all 0 (zero), then the msec argument is assumed to be the millisecond of the day having a range of 0 through 86400000.

# 8.2 EPOCH breakdown

EPOCH breakdown decomposes a CDF EPOCH value into the individual components.

```
SUBROUTINE EPOCH breakdown (
                          ! in -- The CDF EPOCH value.
REAL*8
            epoch,
                                 ! out -- Year (AD, e.g., 1994).
INTEGER*4 year,
INTEGER*4 month,
                                 ! out -- Month (1-12).
INTEGER*4 day,
                                 ! out -- Day (1-31).
INTEGER*4 hour,
                                 ! out -- Hour (0-23).
INTEGER*4 minute,
                                 ! out -- Minute (0-59).
INTEGER*4 second.
                                 ! out -- Second (0-59).
```

# 8.3 encode EPOCH

INTEGER\*4 msec)

encode\_EPOCH encodes a CDF\_EPOCH value into the standard date/time character string. The format of the string is dd-mmm-yyyy hh:mm:ss.ccc where dd is the day of the month (1-31), mmm is the month (Jan, Feb, Mar, Apr, May, Jun, Jul, Aug, Sep, Oct, Nov, or Dec), yyyy is the year, hh is the hour (0-23), mm is the minute (0-59), ss is the second (0-59), and ccc is the millisecond (0-999).

! out -- Millisecond (0-999).

```
SUBROUTINE encode_EPOCH (

REAL*8 epoch; ! in -- The CDF_EPOCH value.

CHARACTER epString*(EPOCH_STRING_LEN)) ! out -- The standard date/time character string.
```

 $EPOCH\_STRING\_LEN \ is \ defined \ in \ cdf. inc.$ 

# 8.4 encode EPOCH1

encode\_EPOCH1 encodes a CDF\_EPOCH value into an alternate date/time character string. The format of the string is yyyymmdd.tttttt, where yyyy is the year, mm is the month (1-12), dd is the day of the month (1-31), and ttttttt is the fraction of the day (e.g., 5000000 is 12 o'clock noon).

```
SUBROUTINE encode_EPOCH1(

REAL*8 epoch; ! in -- The CDF_EPOCH value.
CHARACTER epString*(EPOCH1_STRING_LEN)) ! out -- The alternate date/time character string.

EPOCH1 STRING LEN is defined in cdf.inc.
```

# 8.5 encode EPOCH2

encode\_EPOCH2 encodes a CDF\_EPOCH value into an alternate date/time character string. The format of the string is yyyymoddhhmmss where yyyy is the year, mo is the month (1-12), dd is the day of the month (1-31), hh is the hour (0-23), mm is the minute (0-59), and ss is the second (0-59).

```
SUBROUTINE encode_EPOCH2 (

REAL*8 epoch; ! in -- The CDF_EPOCH value.
CHARACTER epString*(EPOCH2_STRING_LEN)) ! out -- The alternate date/time character string.

EPOCH2 STRING LEN is defined in cdf.inc.
```

### 8.6 encode\_EPOCH3

encode\_EPOCH3 encodes a CDF\_EPOCH value into an alternate date/time character string. The format of the string is yyyy-mo-ddThh:mm:ss.cccZ where yyyy is the year, mo is the month (1-12), dd is the day of the month (1-31), hh is the hour (0-23), mm is the minute (0-59), ss is the second (0-59), and ccc is the millisecond (0-999).

```
SUBROUTINE encode_EPOCH3 (

REAL*8 epoch; ! in -- The CDF_EPOCH value.

CHARACTER epString*(EPOCH3_STRING_LEN)) ! out -- The alternate date/time character string.
```

EPOCH3\_STRING\_LEN is defined in cdf.inc.

## 8.7 encode\_EPOCHx

encode\_EPOCHx encodes a CDF\_EPOCH value into a custom date/time character string. The format of the encoded string is specified by a format string.

```
SUBROUTINE encode_EPOCHx (

REAL*8 epoch; ! in -- The CDF_EPOCH value.

CHARACTER format*(EPOCHx_FORMAT_MAX) ! in -- The format string.

CHARACTER encoded*(EPOCHx_STRING_MAX)) ! out -- The custom date/time character string.
```

The format string consists of EPOCH components which are encoded and text which is simply copied to the encoded custom string. Components are enclosed in angle brackets and consist of a component token and an optional width. The syntax of a component is: <token[.width]>. If the optional width contains a leading zero, then the component will be encoded with leading zeroes (rather than leading blanks).

The supported component tokens and their default widths are as follows. . .

Token	Meaning	Default
dom	Day of month (1-31)	<dom.0></dom.0>
doy	Day of year (001-366)	<doy.03></doy.03>
month	Month ('Jan', 'Feb',, 'Dec')	<month></month>
mm	Month (1,2,,12)	<mm.0></mm.0>
year	Year (4-digit)	<year.04></year.04>
yr	Year (2-digit)	<yr.02></yr.02>
hour	Hour (00-23)	<hour.02></hour.02>
min	Minute (00-59)	<min.02></min.02>

sec	Second (00-59)	<sec.02></sec.02>
fos	Fraction of second.	<fos.3></fos.3>
fod	Fraction of day.	<fod.8></fod.8>

Note that a width of zero indicates that as many digits as necessary should be used to encoded the component. The <month> component is always encoded with three characters. The <fos> and <fod> components are always encoded with leading zeroes.

If a left angle bracket is desired in the encoded string, then simply specify two left angle brackets (<<) in the format string (character stuffing).

For example, the format string used to encode the standard EPOCH date/time character string (see Section 8.3) would be. . .

```
<dom.02>-<month>-<year> <hour>:<min>:<sec>.<fos>
```

EPOCHx\_FORMAT\_LEN and EPOCHx\_STRING\_MAX are defined in cdf.inc.

## 8.8 parse EPOCH

parse\_EPOCH parses a standard date/time character string and returns a CDF\_EPOCH value. The format of the string is that produced by the encode\_EPOCH function described in Section 8.3. If an illegalfield is detected in the string the value returned will be ILLEGAL\_EPOCH\_VALUE.

```
SUBROUTINE parse_EPOCH (

CHARACTER epString*(EPOCH_STRING_LEN), ! in -- The standard date/time character string.

REAL*8 epoch) ! out -- CDF_EPOCH value
```

EPOCH\_STRING\_LEN is defined in cdf.inc.

EPOCH1 STRING LEN is defined in cdf.inc.

# 8.9 parse\_EPOCH1

parse\_EPOCH1 parses An alternate date/time character string and returns a CDF\_EPOCH value. The format of the string is that produced by the encode\_EPOCH1 function described in Section 8.4. If an illegalfield is detected in the string the value returned will be ILLEGAL EPOCH VALUE.

# 8.10 parse\_EPOCH2

parse\_EPOCH2 parses An alternate date/time character string and returns a CDF\_EPOCH value. The format of the string is that produced by the encode\_EPOCH2 function described in Section 8.5. If an illegalfield is detected in the string the value returned will be ILLEGAL\_EPOCH\_VALUE.

```
SUBROUTINE parse_EPOCH2 (

CHARACTER epString*(EPOCH2_STRING_LEN), ! in -- The standard date/time character string.

REAL*8 epoch) ! out -- CDF_EPOCH value
```

EPOCH2\_STRING\_LEN is defined in cdf.inc.

## 8.11 parse\_EPOCH3

parse\_EPOCH3 parses An alternate date/time character string and returns a CDF\_EPOCH value. The format of the string is that produced by the encode\_EPOCH3 function described in Section 8.6. If an illegalfield is detected in the string the value returned will be ILLEGAL\_EPOCH\_VALUE.

```
SUBROUTINE parse_EPOCH3 (

CHARACTER epString*(EPOCH3_STRING_LEN), ! in -- The standard date/time character string.

REAL*8 epoch) ! out -- CDF_EPOCH value
```

EPOCH3\_STRING\_LEN is defined in cdf.inc.

# 8.12 compute\_EPOCH16

compute\_EPOCH16 calculates a CDF\_EPOCH16 value given the individual components. If An illegal component is detected, the value returned will be ILLEGAL EPOCH VALUE.

```
SUBROUTINE compute EPOCH16 (
```

```
INTEGER*4 year,
                                  ! in -- Year (AD, e.g., 1994).
INTEGER*4 month,
                                  ! in -- Month (1-12).
INTEGER*4 day,
                                  ! in -- Day (1-31).
INTEGER*4 hour,
                                  ! in -- Hour (0-23).
                                  ! in -- Minute (0-59).
INTEGER*4 minute,
                                  ! in -- Second (0-59).
INTEGER*4 second.
                                  ! in -- Millisecond (0-999).
INTEGER*4 msec,
INTEGER*4 usec,
                                  ! in -- Microsecond (0-999).
INTEGER*4 nsec,
                                  ! in -- Nanosecond (0-999).
                                  ! in -- Picosecond (0-999).
INTEGER*4 psec,
REAL*8
           epoch(2)
                                  ! out-- CDF EPOCH16 value
```

## 8.13 EPOCH16\_breakdown

EPOCH16 breakdown decomposes a CDF EPOCH16 value into the individual components.

SUBROUTINE EPOCH\_breakdown (

```
REAL*8
                                  ! in -- The CDF EPOCH16 value.
           epoch(2),
                                  ! out -- Year (AD, e.g., 1994).
INTEGER*4 year,
INTEGER*4 month,
                                  ! out -- Month (1-12).
                                  ! out -- Day (1-31).
INTEGER*4 day,
                                  ! out -- Hour (0-23).
INTEGER*4 hour,
INTEGER*4 minute,
                                 ! out -- Minute (0-59).
                                 ! out -- Second (0-59).
INTEGER*4 second,
INTEGER*4 msec.
                                 ! out -- Millisecond (0-999).
INTEGER*4 usec,
                                 ! out -- Microsecond (0-999).
                                 ! out -- Nanosecond (0-999).
INTEGER*4 nsec,
INTEGER*4 psec)
                                  ! out -- Picosecond (0-999).
```

# 8.14 encode\_EPOCH16

encode\_EPOCH16 encodes a CDF\_EPOCH16 value into the standard date/time character string. The format of the string is dd-mmm-yyyy hh:mm:ss.ccc.uuu.nnn.ppp where dd is the day of the month (1-31), mmm is the month (Jan, Feb, Mar, Apr, May, Jun, Jul, Aug, Sep, Oct, Nov, or Dec), yyyy is the year, hh is the hour (0-23), mm is the minute (0-59), ss is the second (0-59), ccc is the millisecond (0-999), uuu is the microsecond (0-999), nnn is the nanosecond (0-999), and ppp is the picosecond (0-999).

```
SUBROUTINE encode_EPOCH16 (

REAL*8 epoch(2), ! in -- The CDF_EPOCH16 value.

CHARACTER epString*(EPOCH16_STRING_LEN)) ! out -- The standard date/time string.
```

EPOCH16\_STRING\_LEN is defined in cdf.inc.

# 8.15 encode\_EPOCH16\_1

encode\_EPOCH16\_1 encodes a CDF\_EPOCH16 value into an alternate date/time character string. The format of the string is yyyymmdd.ttttttttttttt, where yyyy is the year, mm is the month (1-12), dd is the day of the month (1-31), and ttttttttttttttttttttttt is the fraction of the day (e.g., 5000000000000000000).

```
SUBROUTINE encode_EPOCH16_1(

REAL*8 epoch(2), ! in -- The CDF_EPOCH16 value.

CHARACTER epString*(EPOCH16_1_STRING_LEN)) ! out -- The date/time string.
```

EPOCH16\_1\_STRING\_LEN is defined in cdf.inc.

### 8.16 encode EPOCH16 2

encode\_EPOCH16\_2 encodes a CDF\_EPOCH16 value into an alternate date/time character string. The format of the string is yyyymoddhhmmss where yyyy is the year, mo is the month (1-12), dd is the day of the month (1-31), hh is the hour (0-23), mm is the minute (0-59), and ss is the second (0-59).

```
SUBROUTINE encode_EPOCH16_2 (

REAL*8 epoch(2), ! in -- The CDF_EPOCH16 value.

CHARACTER epString*(EPOCH16_2_STRING_LEN)) ! out -- The date/time string.
```

# 8.17 encode EPOCH16 3

EPOCH16 2 STRING LEN is defined in cdf.inc.

encode\_EPOCH16\_3 encodes a CDF\_EPOCH16 value into an alternate date/time character string. The format of the string is yyyy-mo-ddThh:mm:ss.ccc.uuu.nnn.pppZ where yyyy is the year, mo is the month (1-12), dd is the day of the month (1-31), hh is the hour (0-23), mm is the minute (0-59), ss is the second (0-59), ccc is the millisecond (0-999), uuu is the microsecond (0-999), nnn is the nanosecond (0-999), and ppp is the picosecond (0-999).

```
SUBROUTINE encode_EPOCH16_3 (

REAL*8 epoch(2), ! in -- The CDF_EPOCH16 value.

CHARACTER epString*(EPOCH16_3_STRING_LEN)) ! out -- The date/time string.
```

EPOCH16\_3\_STRING\_LEN is defined in cdf.inc.

# 8.18 encode\_EPOCH16\_x

encode\_EPOCH16\_x encodes a CDF\_EPOCH16 value into a custom date/time character string. The format of the encoded string is specified by a format string.

```
SUBROUTINE encode_EPOCH16_x (

REAL*8 epoch(2); ! in -- The CDF_EPOCH16 value.

CHARACTER format*(EPOCHx_FORMAT_MAX) ! in -- The format string.

CHARACTER encoded*(EPOCHx_STRING_MAX)) ! out -- The custom date/time character string.
```

The format string consists of EPOCH components which are encoded and text which is simply copied to the encoded custom string. Components are enclosed in angle brackets and consist of a component token and an optional width. The syntax of a component is: <token[.width]>. If the optional width contains a leading zero, then the component will be encoded with leading zeroes (rather than leading blanks).

The supported component tokens and their default widths are as follows.

Token	Meaning	Default
dom	Day of month (1-31)	<dom.0></dom.0>
doy	Day of year (001-366)	<doy.03></doy.03>

```
month
            Month ('Jan', 'Feb',..., 'Dec')
                                               <month>
            Month (1,2,...,12)
                                      < mm.0 >
mm
            Year (4-digit)
                                               <vear.04>
year
            Year (2-digit)
                                               <yr.02>
yr
            Hour (00-23)
                                               <hour.02>
hour
            Minute (00-59)
                                               <min.02>
min
            Second (00-59)
                                               <sec.02>
sec
            Millisecond (000-999)
                                               <msec.3>
msec
            Microsecond (000-999)
                                               <usec.3>
usec
            Nanosecond (000-999)
                                               <nsec.3>
nsec
psec
            Picosecond (000-999)
                                               <psec.3>
                                               <fos.3>
            Fraction of second.
fos
                                      <fod.8>
fodFraction of day.
```

Note that a width of zero indicates that as many digits as necessary should be used to encoded the component. The <month> component is always encoded with three characters. The <fos> and <fod> components are always encoded with leading zeroes.

If a left angle bracket is desired in the encoded string, then simply specify two left angle brackets (<<) in the format string (character stuffing).

For example, the format string used to encode the standard EPOCH date/time character string (see Section 8.3) would be. . .

```
<dom.02>-<month>-<year> <hour>:<min>:<sec>.<msec>.<usec>.<nsec>.<fos>
```

EPOCHx\_FORMAT\_LEN and EPOCHx\_STRING\_MAX are defined in cdf.inc.

# 8.19 parse EPOCH16

parse\_EPOCH16 parses a standard date/time character string and returns a CDF\_EPOCH16 value. The format of the string is that produced by the encode\_EPOCH16 function. If an illegal field is detected in the string the value returned will be ILLEGAL\_EPOCH\_VALUE.

```
SUBROUTINE parse_EPOCH16 (

CHARACTER epString*(EPOCH16_STRING_LEN), ! in -- The date/time string.

REAL*8 epoch(2)) ! out -- CDF_EPOCH16 value
```

EPOCH16 STRING LEN is defined in cdf.inc.

# **8.20** parse EPOCH16 1

parse\_EPOCH16\_1 parses An alternate date/time character string and returns a CDF\_EPOCH16 value. The format of the string is that produced by the encode\_EPOCH16\_1 function. If an illegal field is detected in the string the value returned will be ILLEGAL EPOCH VALUE.

```
SUBROUTINE parse_EPOCH16_1 (
```

```
CHARACTER epString*(EPOCH16_1_STRING_LEN), ! in -- The date/time string.

REAL*8 epoch(2)) ! out -- CDF_EPOCH16 value
```

EPOCH16 1 STRING LEN is defined in cdf.inc.

### **8.21** parse EPOCH16 2

parse\_EPOCH16\_2 parses An alternate date/time character string and returns a CDF\_EPOCH16 value. The format of the string is that produced by the encode\_EPOCH16\_2 function. If an illegal field is detected in the string the value returned will be ILLEGAL\_EPOCH\_VALUE.

```
SUBROUTINE parse_EPOCH16_2 (

CHARACTER epString*(EPOCH16_2_STRING_LEN), ! in -- The date/time string.

REAL*8 epoch(2)) ! out -- CDF_EPOCH16 value
```

EPOCH16 2 STRING LEN is defined in cdf.inc.

### 8.22 parse\_EPOCH16\_3

parse\_EPOCH16\_3 parses An alternate date/time character string and returns a CDF\_EPOCH16 value. The format of the string is that produced by the encode\_EPOCH16\_3 function. If an illegal field is detected in the string the value returned will be ILLEGAL\_EPOCH\_VALUE.

```
SUBROUTINE parse_EPOCH16_3 (

CHARACTER epString*(EPOCH16_3_STRING_LEN ), ! in -- The date/time string.

REAL*8 epoch(2)) ! out -- CDF_EPOCH16 value
```

EPOCH16 3 STRING LEN is defined in cdf.inc.

# Appendix A

# Status Codes

#### A.1 Introduction

A status code is returned from most CDF functions. The cdf.inc (for C) and CDF.INC (for Fortran) include files contain the numerical values (constants) for each of the status codes (and for any other constants referred to in the explanations). The CDF library Standard Interface functions CDFerror (for C) and CDF\_error (for Fortran) can be used within a program to inquire the explanation text for a given status code. The Internal Interface can also be used to inquire explanation text.

There are three classes of status codes: informational, warning, and error. The purpose of each is as follows:

Informational Indicates success but provides some additional information that may be of interest to an

application.

Warning Indicates that the function completed but possibly not as expected.

Error Indicates that a fatal error occurred and the function aborted.

Status codes fall into classes as follows:

Error codes < CDF WARN < Warning codes < CDF OK < Informational codes

CDF\_OK indicates an unqualified success (it should be the most commonly returned status code). CDF\_WARN is simply used to distinguish between warning and error status codes.

### A.2 Status Codes and Messages

The following list contains an explanation for each possible status code. Whether a particular status code is considered informational, a warning, or an error is also indicated.

ATTR EXISTS

Named attribute already exists - cannot create or rename. Each attribute in a CDF must have a unique name. Note that trailing

	names. [Error]
ATTR_NAME_TRUNC	Attribute name truncated to CDF_ATTR_NAME_LEN characters. The attribute was created but with a truncated name. [Warning]
BAD_ALLOCATE_RECS	An illegal number of records to allocate for a variable was specified. For RV variables the number must be one or greater. For NRV variables the number must be exactly one. [Error]
BAD_ARGUMENT	An illegal/undefined argument was passed. Check that all arguments are properly declared and initialized. [Error]
BAD_ATTR_NAME	Illegal attribute name specified. Attribute names must contain at least one character, and each character must be printable. [Error]
BAD_ATTR_NUM	Illegal attribute number specified. Attribute numbers must be zero (0) or greater for C applications and one (1) or greater for Fortran applications. [Error]
BAD_BLOCKING_FACTOR <sup>1</sup>	An illegal blocking factor was specified. Blocking factors must be at least zero (0). [Error]
BAD_CACHESIZE	An illegal number of cache buffers was specified. The value must be at least zero (0). [Error]
BAD_CDF_EXTENSION	An illegal file extension was specified for a CDF. In general, do not specify an extension except possibly for a single-file CDF which has been renamed with a different file extension or no file extension. [Error]
BAD_CDF_ID	CDF identifier is unknown or invalid. The CDF identifier specified is not for a currently open CDF. [Error]
BAD_CDF_NAME	Illegal CDF name specified. CDF names must contain at least one character, and each character must be printable. Trailing blanks are allowed but will be ignored. [Error]
BAD_CDFSTATUS	Unknown CDF status code received. The status code specified is not used by the CDF library. [Error]
BAD_COMPRESSION_PARM	An illegal compression parameter was specified. [Error]
BAD_DATA_TYPE	An unknown data type was specified or encountered. The CDF data types are defined in cdf.inc for C applications and in cdf.inc for Fortran applications. [Error]
BAD_DECODING	An unknown decoding was specified. The CDF decodings are defined in odf inc for C applications and in odf inc for Fortran

blanks are ignored by the CDF library when comparing attribute

defined in cdf.inc for C applications and in cdf.inc for Fortran

<sup>1</sup> The status code BAD\_BLOCKING\_FACTOR was previously named BAD\_EXTEND\_RECS.

applications. [Error]

BAD DIM COUNT Illegal dimension count specified. A dimension count must be at least one (1) and not greater than the size of the dimension. [Error] BAD DIM INDEX One or more dimension index is out of range. A valid value must be specified regardless of the dimension variance. Note also that the combination of dimension index, count, and interval must not specify an element beyond the end of the dimension. [Error] Illegal dimension interval specified. Dimension intervals must be BAD DIM INTERVAL at least one (1). [Error] Illegal dimension size specified. A dimension size must be at BAD DIM SIZE least one (1). [Error] BAD ENCODING Unknown data encoding specified. The CDF encodings are defined in cdf.inc for C applications and in cdf.inc for Fortran applications. [Error] BAD\_ENTRY\_NUM Illegal attribute entry number specified. Entry numbers must be at least zero (0) for C applications and at least one (1) for Fortran applications. [Error] The specified function or item is illegal. Check that the proper BAD FNC OR ITEM number of arguments are specified for each operation being performed. Also make sure that NULL is specified as the last operation. [Error] Unknown format specified. The CDF formats are defined in BAD FORMAT cdf.inc for C applications and in cdf.inc for Fortran applications. [Error] BAD INITIAL RECS An illegal number of records to initially write has been specified. The number of initial records must be at least one (1). [Error] Unknown variable majority specified. The CDF variable BAD MAJORITY majorities are defined in cdf.inc for C applications and in cdf.inc for Fortran applications. [Error] BAD MALLOC Unable to allocate dynamic memory - system limit reached. Contact CDF User Support if this error occurs. [Error] BAD NEGtoPOSfp0 MODE An illegal -0.0 to 0.0 mode was specified. The -0.0 to 0.0 modes are defined in cdf.inc for C applications and in cdf.inc for Fortran applications. [Error] BAD NUM DIMS The number of dimensions specified is out of the allowed range. Zero (0) through CDF MAX DIMS dimensions are allowed. If more are needed, contact CDF User Support. [Error] BAD NUM ELEMS The number of elements of the data type is illegal. The number of elements must be at least one (1). For variables with a noncharacter data type, the number of elements must always be one (1). [Error] BAD NUM VARS Illegal number of variables in a record access operation. [Error]

BAD READONLY MODE Illegal read-only mode specified. The CDF read-only modes are defined in cdf.inc for C applications and in cdf.inc for Fortran applications. [Error] Illegal record count specified. A record count must be at least BAD REC COUNT one (1). [Error] BAD\_REC\_INTERVAL Illegal record interval specified. A record interval must be at least one (1). [Error] BAD REC NUM Record number is out of range. Record numbers must be at least zero (0) for C applications and at least one (1) for Fortran applications. Note that a valid value must be specified regardless of the record variance. [Error] BAD SCOPE Unknown attribute scope specified. The attribute scopes are defined in cdf.inc for C applications and in cdf.inc for Fortran applications. [Error] BAD\_SCRATCH\_DIR An illegal scratch directory was specified. The scratch directory must be writeable and accessable (if a relative path was specified) from the directory in which the application has been executed. [Error] An illegal sparse arrays parameter was specified. [Error] BAD SPARSEARRAYS PARM BAD VAR NAME Illegal variable name specified. Variable names must contain at least one character and each character must be printable. [Error] Illegal variable number specified. Variable numbers must be BAD VAR NUM zero (0) or greater for C applications and one (1) or greater for Fortran applications. [Error] BAD zMODE

Illegal zMode specified. The CDF zModes are defined in cdf.inc for C applications and in cdf.inc for FortrAn applications. [Error]

Records cannot be allocated for the given type of variable (e.g., a compressed variable). [Error]

Because of dependencies on the value, it cannot be changed. Some possible causes of this error follow:

- 1. Changing a CDF's data encoding after a variable value (including a pad value) or an attribute entry has been written.
- 2. Changing a CDF's format after a variable has been created or if a compressed single-file CDF.
- 3. Changing a CDF's variable majority after a variable value (excluding a pad value) has been written.
- 4. Changing a variable's data specification after a value (including the pad value) has been written to that variable or after records have been allocated for that variable.

CANNOT ALLOCATE RECORDS

CANNOT CHANGE

- Changing a variable's record variance after a value (excluding the pad value) has been written to that variable or after records have been allocated for that variable.
- 6. Changing a variable's dimension variances after a value (excluding the pad value) has been written to that variable or after records have been allocated for that variable.
- 7. Writing "initial" records to a variable after a value (excluding the pad value) has already been written to that variable.
- Changing a variable's blocking factor when a compressed variable and a value (excluding the pad value) has been written or when a variable with sparse records and a value has been accessed.
- 9. Changing an attribute entry's data specification wherethe new specification is not equivalent to the old specification.

The CDF or variable cannot be compressed. For CDFs, this occurs if the CDF has the multi-file format. For variables, this occurs if the variable is in a multi-file CDF, values have been written to the variable, or if sparse arrays have already been specified for the variable. [Error]

Sparse arrays cannot be specified for the variable. This occurs if the variable is in a multi-file CDF, values have been written to the variable, records have been allocated for the variable, or if compression has already been specified for the variable. [Error]

Sparse records cannot be specified for the variable. This occurs if the variable is in a multi-file CDF, values have been written to the variable, or records have been allocated for the variable. [Error]

Error detected while trying to close CDF. Check that sufficient disk space exists for the dotCDF file and that it has not been corrupted. [Error]

Cannot create the CDF specified - error from file system. Make sure that sufficient privilege exists to create the dotCDF file in the disk/directory location specified and that an open file quota has not already been reached. [Error]

Cannot delete the CDF specified - error from file system. Unsufficient privileges exist the delete the CDF file(s). [Error]

The CDF named already exists - cannot create it. The CDF library will not overwrite an existing CDF. [Error]

An unexpected condition has occurred in the CDF library. Report this error to CDF support. [Error]

CANNOT\_COMPRESS

CANNOT\_SPARSEARRAYS

CANNOT SPARSERECORDS

CDF CLOSE ERROR

CDF CREATE ERROR

CDF DELETE ERROR

CDF EXISTS

CDF\_INTERNAL\_ERROR

CDF NAME TRUNC CDF file name truncated to CDF PATHNAME LEN characters. The CDF was created but with a truncated name. [Warning] CDF OK Function completed successfully. Cannot open the CDF specified - error from file system. Check CDF OPEN ERROR that the dotCDF file is not corrupted and that sufficient privilege exists to open it. Also check that an open file quota has not already been reached. [Error] CDF\_READ\_ERROR Failed to read the CDF file - error from file system. Check that the dotCDF file is not corrupted. [Error] CDF WRITE ERROR Failed to write the CDF file - error from file system. Check that the dotCDF file is not corrupted. [Error] COMPRESSION ERROR An error occured while compressing a CDF or block of variable records. This is an internal error in the CDF library. Contact CDF User Support. [Error] CORRUPTED\_V2\_CDF This Version 2 CDF is corrupted. An error has been detected in the CDF's control information. If the CDF file(s) are known to be valid, please contact CDF User Support. [Error] An error occured while decompressing a CDF or block of DECOMPRESSION ERROR variable records. The most likely cause is a corrupted dotCDF file. [Error] For a compressed variable, a block of records did not compress to DID\_NOT\_COMPRESS smaller than their uncompressed size. They have been stored uncompressed. This can result If the blocking factor is set too low or if the characteristics of the data are such that the compression algorithm choosen is unsuitable. [Informational] EMPTY COMPRESSED CDF The compressed CDF being opened is empty. This will result if a program which was creating/modifying the CDF abnormally terminated. [Error] END OF VAR The sequential access current value is at the end of the variable. Reading beyond the end of the last physical value for a variable is not allowed (when performing sequential access). [Error] A specified parameter was forced to an acceptable value (rather FORCED PARAMETER than an error being returned). [Warning] IBM PC OVERFLOW An operation involving a buffer greater than 64k bytes in size has been specified for PCs running 16-bit DOS/Windows 3.\*. [Error] ILLEGAL\_FOR\_SCOPE The operation is illegal for the attribute's scope. For example, only gEntries may be written for gAttributes - not rEntries or zEntries. [Error] The attempted operation is illegal while in zMode. Most ILLEGAL\_IN\_zMODE operations involving rVariables or rEntries will be illegal. [Error]

ILLEGAL_ON_V1_CDF	The specified operation (i.e., opening) is not allowed on Version 1 CDFs. [Error]
MULTI_FILE_FORMAT	The specified operation is not applicable to CDFs with the multi- file format. For example, it does not make sense to inquire indexing statistics for a variable in a multi-file CDF (indexing is only used in single-file CDFs). [Informational]
NA_FOR_VARIABLE	The attempted operation is not applicable to the given variable. [Warning]
NEGATIVE_FP_ZERO	One or more of the values read/written are -0.0 (An illegal value on VAXes and DEC Alphas running OpenVMS). [Warning]
NO_ATTR_SELECTED	An attribute has not yet been selected. First select the attribute on which to perform the operation. [Error]
NO_CDF_SELECTED	A CDF has not yet been selected. First select the CDF on which to perform the operation. [Error]
NO_DELETE_ACCESS	Deleting is not allowed (read-only access). Make sure that delete access is allowed on the CDF file(s). [Error]
NO_ENTRY_SELECTED	An attribute entry has not yet been selected. First select the entry number on which to perform the operation. [Error]
NO_MORE_ACCESS	Further access to the CDF is not allowed because of a severe error. If the CDF was being modified, an attempt was made to save the changes made prior to the severe error. in any event, the CDF should still be closed. [Error]
NO_PADVALUE_SPECIFIED	A pad value has not yet been specified. The default pad value is currently being used for the variable. The default pad value was returned. [Informational]
NO_STATUS SELECTED	A CDF status code has not yet been selected. First select the status code on which to perform the operation. [Error]
NO_SUCH_ATTR	The named attribute was not found. Note that attribute names are case-sensitive. [Error]
NO_SUCH_CDF	The specified CDF does not exist. Check that the file name specified is correct. [Error]
NO_SUCH_ENTRY	No such entry for specified attribute. [Error]
NO_SUCH_RECORD	The specified record does not exist for the given variable. [Error]
NO_SUCH_VAR	The named variable was not found. Note that variable names are case-sensitive. [Error]
NO_VAR_SELECTED	A variable has not yet been selected. First select the variable on which to perform the operation. [Error]

This CDF contains no rVariables. The operation performed is NO VARS IN CDF not applicable to a CDF with no rVariables. [Informational] NO WRITE ACCESS Write access is not allowed on the CDF file(s). Make sure that the CDF file(s) have the proper file system privileges and ownership. [Error] NOT\_A\_CDF Named CDF is corrupted or not actually a CDF. This can also occur if an older CDF distribution is being used to read a CDF created by a more recent CDF distribution. Contact CDF User Support if you are sure that the specified file is a CDF that should be readable by the CDF distribution being used. CDF is backward compatible but not forward compatible. [Error] Because of the type of variable, records preceding the range of PRECEEDING RECORDS ALLOCATED records being allocated were automatically allocated as well. [Informational] READ ONLY DISTRIBUTION Your CDF distribution has been built to allow only read access to CDFs. Check with your system manager if you require write access. [Error] The CDF is in read-only mode - modifications are not allowed. READ ONLY MODE [Error] SCRATCH CREATE ERROR Cannot create a scratch file - error from file system. If a scratch directory has been specified, ensure that it is writable. [Error] SCRATCH DELETE ERROR Cannot delete a scratch file - error from file system. [Error] Cannot read from a scratch file - error from file system. [Error] SCRATCH READ ERROR SCRATCH\_WRITE\_ERROR Cannot write to a scratch file - error from file system. [Error] SINGLE FILE FORMAT The specified operation is not applicable to CDFs with the singlefile format. For example, it does not make sense to close a variable in a single-file CDF. [Informational] SOME ALREADY ALLOCATED Some of the records being allocated were already allocated. [Informational] TOO MANY PARMS A type of sparse arrays or compression was encountered having too many parameters. This could be causes by a corrupted CDF or if the CDF was created/modified by a CDF distribution more recent than the one being used. [Error] TOO MANY VARS A multi-file CDF on a PC may contain only a limited number of variables because of the 8.3 file naming convention of MS-DOS. This consists of 100 rVariables and 100 zVariables. [Error] UNKNOWN COMPRESSION An unknown type of compression was specified or encountered. [Error] An unknown type of sparseness was specified or encountered. UNKNOWN\_SPARSENESS [Error]

UNSUPPORTED OPERATION The attempted operation is not supported at this time. [Error] VAR ALREADY CLOSED The specified variable is already closed. [Informational] Error detected while trying to close variable file. Check that VAR CLOSE ERROR sufficient disk space exists for the variable file and that it has not been corrupted. [Error] VAR\_CREATE\_ERROR An error occurred while creating a variable file in a multi-file CDF. Check that a file quota has not been reached. [Error] VAR DELETE ERROR An error occurred while deleting a variable file in a multi-file CDF. Check that sufficient privilege exist to delete the CDF files. [Error] VAR EXISTS Named variable already exists - cannot create or rename. Each variable in a CDF must have a unique name (rVariables and zVariables can not share names). Note that trailing blanks are ignored by the CDF library when comparing variable names. [Error] Variable name truncated to CDF VAR NAME LEN characters. VAR NAME TRUNC The variable was created but with a truncated name. [Warning] An error occurred while opening variable file. Check that VAR OPEN ERROR suffient privilege exists to open the variable file. Also make sure that the associated variable file exists. [Error] Failed to read variable as requested - error from file system. VAR\_READ\_ERROR Check that the associated file is not corrupted. [Error] Failed to write variable as requested - error from file system. VAR\_WRITE\_ERROR Check that the associated file is not corrupted. [Error] VIRTUAL RECORD DATA One or more of the records are virtual (never actually written to the CDF). Virtual records do not physically exist in the CDF file(s) but are part of the conceptual view of the data provided by the CDF library. Virtual records are described in the Concepts

chapter in the CDF User's Guide. [Informational]
